Feb. 15th.—Bowels were moved after the enema, and the stools were of a greenish color. He is still a little hoarse, and, though cheerful, does not care for solid food. From this time on he was all right.

The urine was allowed to stand for five days before testing for carbolic acid. It remained clear and without odor up to the sixth day. When examined it was highly acid, of a dark, smoky color, and did not respond to the test for *free* carbolic acid, viz.: one per cent. watery solution of bromine. The bromine solution is a most delicate test for carbolic acid, showing a decided reaction in a solution of one drop to eight ounces. When the urine was slowly evaporated to dryness on a watch crystal and treated with strong nitric acid, there was a violent reaction, turning the residue first yellow, and afterwards red, and giving off distinct fumes of carbolic acid. These tests were kindly made for me by Mr. Geo. Kneuper, of Canal Street.

Dr. Ignazio Tortora's test for carbolic acid in the urine (*London Medical Record*, Nov. 15, 1877) was in part also used. He directs the urine to be gently heated, an equal part of nitric acid to be added, and then evaporated to dryness. The residue is then dissolved in alcohol, filtered, and treated with carbonate of potash. Picrate of potash, which is of a red color, is produced in solution. Tortora says in the article mentioned, that when urine, passed after taking carbolic acid, and nitric acid are gently heated together, yellow rings form in the capsule, which is a sure sign of the presence of carbolic acid. These rings were obtained by me upon the addition of nitric acid, without the aid of heat. These rings do not indicate the presence of *free* carbolic acid, as no reaction was produced with the bromine, which is certainly a far more delicate test. The points of interest to be derived from this case are: the fact of the stomach being full at the time the poison was taken, and so distributing it that it was not all absorbed at one time, nor allowed to seriously erode the mucous membrane of the stomach; the absence of spasmodic stricture of the œsophagus, which symptom has been observed in numerous cases of poisoning from carbolic acid; the tendency of the acid in its action to paralyze the pneumogastric nerve-centre; and finally, the presence of the acid in the urine in the form of *carbolates*, and not as *free* carbolic acid, as demonstrated by the tests. Some of the acid is probably eliminated by the bowels, as their contents were of a similar color to the urine.

75 West 55th Street.

Progress of Medical Science.

Injuries of the Head.—Every practical surgeon knows the difficulty sometimes attending the diagnosis of injuries about the head, especially when the patient has been drinking before the receipt of the injury. An unfortunate answer to the question, "Is he drunk or dying?" has frequently brought upon our police surgeons no measured censure. In this connection it is interesting to note the opinion of so eminent a surgeon as Mr. Erichsen, who says there is not one absolute method of diagnosis, except by waiting to see the result. "It is impossible," he says, "for any physician or surgeon to discover off-hand and say what the exact cause of the symptoms of coma or compression of the brain may be. This diagnostic point cannot be established by any practitioner, however skilled, or however experienced, unless you give him time." In order to relieve the surgeon of responsibility, Mr. Erichsen suggests the establishment of wards for the reception of such cases, that they may neither disturb the other patients, nor die of neglect.—*The Lancet*, January 26, 1878.

Hypodermic Injection of Dialyzed Iron.—Dr. J. M. Da Costa, of the Pennsylvania Hospital, reports an experiment of his own in the hypodermic injection of dialyzed iron in a case of anæmia, from which he concludes that extremely favorable results may be anticipated in such cases from the subcutaneous administration of the drug. The patient was an unmarried woman, twenty-one years old, with a history of hereditary lung trouble, but had never had rheumatism or malarial fever. Her digestion was fair, and she slept well, tongue pale, conjunctiva pearly, ears bloodless, rapid cardiac action, marked venous hum in the jugulars, total arrest of menses for three months. The nutrition had been excellent up to the date of admission. The daily quantity of iron injected was at first fifteen minims, diluted in water at the beginning, but subsequently given undiluted, and the treatment was continued for two weeks with a gradual advance to thirty minims per day; when menstruation reappeared, the unfavorable symptoms gave way, and the patient was pronounced cured. No abscesses resulted, nor was the slightest tendency to inflammatory action observed at the point of introducing the needle during the progress of the treatment. Dr. Da Costa argues from his success in this case, that the profession should give iron another trial in progressive pernicious anæmia.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, April 13, 1878.

CHLOROFORM AND DENTISTRY.

NOTWITHSTANDING all that has been said regarding the dangers of chloroform for ordinary dental operations, there are still to be found dentists who are willing to take the risks. It is difficult to understand why this is so, unless it be that some members of the dental profession are determined to defy professional opinion and ignore recorded medical experience.

But, whatever may be the explanation, we are every now and then startled by the report of another death from chloroform in the dentist's chair. The latest of the kind comes to us from Philadelphia, and, as it helps to point anew an old moral, we give its history in some detail.

On March 20th, Mrs. Elizabeth Neely, of Hatboro, N. J., went to the office of Dr. H. G. Winslow, dentist, of Philadelphia, to have some teeth extracted. Dr. Winslow asked the patient whether she was in perfectly good health, and, upon her answering in the affirmative, at once proceeded to administer chloroform without making any previous examination of the woman's heart. Three teeth were extracted following the first administration of the drug. The Doctor again applied the anæsthetic and had extracted another tooth, when he was alarmed by discovering that his patient had stopped breathing. Electricity and other restoratives were at once employed, and several well-known practitioners called in, but their combined efforts could not resuscitate the unfortunate woman; she had died from heart disease precipitated by the incautious use of chloroform. Dr. Winslow at once surrendered himself to the authorities, and has been upon bail ever since. The Coroner's office was densely packed the other day upon the occasion of the inquest upon the body of Mrs. Neely. The Coroner's physician detailed the result of the post-mortem, which showed that the heart had been diseased. After the hearing of all the testimony taken, the jury rendered the following verdict:

"We find that Elizabeth Neely came to her death March 20, 1877, at No. 224 North Tenth Street (Philadelphia), from chloroform, administered by H. G. Winslow, M.D., and we find the said Dr. Winslow guilty of criminal ignorance in administering so powerful a remedy without having made any previous examination of his patient."

Coroner Gilbert, addressing Dr. Winslow, said:

"Dr. Winslow, before discharging this case, I must perform a duty which I owe to the community as their representative in this office, and that is to censure you for using so dangerous a remedy as chloroform in so trifling an operation as the extraction of teeth, more especially when you have at your command a much safer substitute in sulphuric acid, and a perfectly harmless one in nitrous-oxide gas. You are not only to be censured for using chloroform in such a case, but also for using it without having previously made a careful examination into the physical condition of the various organs of your patient's system. Chloroform is a most powerful sedative, and far more dangerous to life than any of the other anæsthetics. On this account a number of hospitals have prohibited its use. The medical profession has, almost unanimously, settled down to the opinion that it should only be used in capital operations, and then only after the most careful examination. Although the verdict of the jury and this censure will not bring back the mother to the little ones, or the wife to the husband, it may be the means of directing the attention of dental surgeons to a more careful use of chloroform, and of the community—which is the party most interested—to the great danger attending its use, and thus perhaps similar accidents may be avoided in the future."

The accused was then committed by the Coroner to await the action of the grand jury.

The verdict in this case was an eminently proper one, and it is what might have been expected from the character of the testimony offered to the Coroner's jury. But it has an additional significance in connection with the fact that the jury was composed entirely of medical men. It is hard to arrive at any other conclusion than that the neglect to examine into the patient's condition, or even to feel her pulse, was not only culpable, but actually criminal. In this instance it would appear that death was the direct result of such negligence on the part of the gentleman administering the anæsthetic, inasmuch as a previous knowledge of the patient's condition, which an examination of the chest organs would have afforded, would have, or at least should have, ruled chloroform entirely out of the question. There is but little doubt that the grand jury will sustain the Coroner's verdict, and that the case will come up in the court for trial. There will then, doubtless, be brought up many interesting

scientific points connected with the case, which will invite further comment.

In respect to neglect of previously examining the patient, the case is similar to the recent Rahway tragedy, in which the boy died in the dentist's chair as the result of chloroform-poisoning. In that instance, however, the heart, and, in fact, all the organs of the body were in a healthy condition at the time, the only special contra-indication to chloroform being a full stomach, which condition was not ascertained previous to the administration of the anæsthetic. Although there was no doubt, from a medical point of view, that the boy's death was caused by chloroform carelessly administered it was difficult to prove that point, more especially as the prosecuting officer in that case did not seem to be equal to the occasion. As will be recollected, the line of defence was that of idiosyncrasy on the part of the patient, and the jury gave the prisoner the benefit of a doubt regarding that point. In the case of Dr. Winslow, however, it does not appear that such a defence can be urged, inasmuch as the heart was unhealthy, and of itself directly invited the fatal issue.

PAUPER LUNATICS IN ENGLAND.

It seems very doubtful, notwithstanding the somewhat rose-colored views of Dr. Wilbur, whether the pauper lunatics of Great Britain are any better provided for than ours. Not long since, according to recent medical advices, a deputation representing Leeds, Birmingham, and other large cities, had an interview with Mr. Sclater-Booth, with the purpose of asking the government to give, with regard to paupers maintained by the unions, the same relief that is given to county asylums; and it was argued that if the pauper lunatics in asylums entitled those institutions to certain payments in the nature of subsidies, similar payments ought to be made on behalf of lunatics of the same class in the special wards of workhouses. In reply to the petitioners, Mr. Sclater-Booth stated that the sum voted in 1875–76, to pay a subvention of four shillings a head for lunatics in asylums, amounted to 330,000 pounds per year, and that the amount to be found in the civil service estimates for that purpose for the year 1878, was 385,000 pounds, showing an addition of 55,000 pounds in the course of four years. Incidentally, the Commissioner supplied certain data for ascertaining the number of pauper lunatics in the poor-houses of London, by alluding to the state of facts existing there. He stated one instance, that 5,000 pauper insane were maintained in the London asylums for incurables, at a weekly cost per capita of seven shillings; but were a subvention of four shillings a head to be extended to the workhouses and poor-houses for the pauper lunatics confined in them, it would require 40,000 pounds a year for London alone, which, by calculation, provides for an aggregate of 4,000 pauper insane in that city, for whom no special provision exists. This, according to expert estimates, is about three times the number not specially provided for in the whole State of New York.

THE OUT-PATIENT DEPARTMENT OF THE NEW YORK HOSPITAL AND THE ABUSE OF MEDICAL CHARITY.

Concerning the present management of the out-patient department of the New York Hospital there appears to be but one opinion in professional circles. It is almost past belief that any board of managers of any respectable institution should, with such a set of rules, ever expect the countenance and support of its best friends. Perhaps, however, it dares to be ridiculous and absurd, because it presumes to be independent of popular or professional opinion. There is some ground for such a suspicion, from the fact that this board, from time immemorial, has been flattered and coaxed by many of the best men in the profession, until it would seem to be past the possibility of receiving any suggestion, or beyond the reach of any reasonable and respectful appeal. We believe, however, despite the recent action of the board concerning the protest of the East River Association, that some radical movement on the part of the profession will be made to bring up the matter for discussion again, with a view of effecting the necessary changes in the present management, and correcting the gross abuses of medical charity which are so directly invited by the existing regulations.

This out-patient department of the New York Hospital, although ostensibly established for the purpose of inaugurating the provident dispensary system, has, in reality, proved to be the greatest barrier to its realization. With a pretence of cultivating a certain amount of self-respect among those who can afford to pay only a small fee, it opens the door for the most bare-faced frauds, not only upon the profession, which always freely gives to the really poor, but to the poor themselves, to whom, and only to whom, such services belong. The management of this out-patient department is at the bottom of the worst possible abuses of medical charity, and until its plans are changed there is no use to hope for any of the necessary reforms which might initiate a proper and practical provident system.

We have repeatedly said that there was no objection to the small-fee system for those who could not pay more, but even the governors of the New York Hospital, and particularly the gentleman who has the reputation of being the dictator of the board, have no right to establish the low fee for all classes of applicants, and thus set a merely nominal price upon first-class medical services. It would have been eminently proper for the board to have striven to solve in a practical way some of the problems of the provident system. With abundance of means at its command,

and with the advantages of making new rules to suit a new administration, there was nothing to stand in its way. But instead of so doing, it has ignored all the rights of the profession, placed a premium upon fraud, and lost sight of every other consideration save that of adding to an already enormous income.

The profession asks for so little in this matter, it is surprising that its wishes were not long ago anticipated rather than ignored, as in the case of the East River Medical Association. Perhaps the committee of the County Society which has the matter now in charge may be more successful when it gets ready for work. If the proper spirit is shown, and the right determination manifested, there is no reason why some report should not be made at the next meeting of the Society. In the mean time it may not appear presumptuous to ask its opinion concerning the following articles which appear in the printed rules governing the admission of patients:

"All persons without distinction are entitled to receive the benefits of this branch (out-patient) of the hospital service, subject only to such regulations as may be deemed expedient." . . . . . "Applicants will be furnished with a card of admission which will give the privileges of the service for one month." . . . . "The price of the card of admission will be $1.00. Prescriptions will be put up for 10 cents each." . . . . "All patients from the country will be furnished with a written diagnosis of their disease, which will be directed to their local physician, with suggestions as to proper treatment and remedies."

Reports of Societies.

NEW YORK ACADEMY OF MEDICINE.

SECTION OF THEORY AND PRACTICE OF MEDICINE.

Stated Meeting, March 12, 1878.

DR. E. F. WARD, CHAIRMAN.

THE DIAGNOSIS AND TREATMENT OF DIPHTHERIA.

A REGULAR meeting of the Section was held at the rooms of the Academy, 12 West 31st Street, on Tuesday evening, March 19th, when the Chair announced the subject for discussion as above. It had been expected that Dr. T. H. White would read a paper on diphtheria; but, unfortunately, he had not had the time to prepare it, nor was he able to be present to state his views.

DR. ALEXANDER HADDEN was the first speaker. In order to open the discussion, he said he would ask a question, viz.: Is diphtheria a disease *per se*, or is it an affection which is superinduced upon a previously inflamed condition of the mucous membrane of the throat or other parts? From the tone of a number of papers that have of late appeared in the medical journals, he would be led to infer that it was to be regarded merely as a local condition which may supervene upon any inflamed surface, and which would bear much the same relation to that part that erysipelas or gangrene would to an ordinary wound. These papers, he went on to say (and he mentioned those of Drs. Jacobi and Billington particularly), leave us somewhat in doubt in regard to the matter. At first they seem to speak of diphtheria as a distinct disease, but afterwards to regard it largely as merely a condition, and local in its manipulations. As for himself, he would be inclined to believe that it is a disease in itself. The principal grounds for that opinion were found in the fact that though the local symptoms might be of a very trivial character, the affection might still be attended or followed by the most serious troubles, such as violent nephritis, enlarged liver or spleen, paralysis, etc., as he himself had not infrequently observed. He thought that the mere local lesions were quite insufficient to account for the after-symptoms, and he had never heard of a case of simple or follicular tonsillitis being followed by paralysis. Yet he had seen the most extensive paralysis result from very slight cases of diphtheria, and he had also observed the same phenomena in children who had had no pseudo-membranous exudations whatever upon any portion of the mucous membrane (as far as could be observed, or even suspected), but who belonged to families some other members of which exhibited the ordinary symptoms of diphtheria. He mentioned a case in point, that of a child three years of age. Nephritis, too, was very common, even where the local lesions were not at all well marked.

There was another class of cases, on the other hand, in which the local symptoms were of the most violent character, and accompanied by a very high degree of temperature. In these gangrene frequently set in, and death occurred very rapidly—sometimes in forty-eight or fifty hours from the commencement of the attack. In these he could easily understand how a septicæmic condition had been caused; for death could not be attributed either to asphyxia or to interference with the cerebral circulation, the lesions being usually confined principally to one side of the throat, and, therefore, not offering sufficient obstruction to prevent venous return from the brain.

DR. J. LEWIS SMITH said that, as regards grave constitutional symptoms in connection with very slight local lesions, he could recall two striking cases in which there was scarcely any pseudo-membrane in the fauces, and no catarrhal symptoms sufficient to account for any deposit at all upon the Schneiderian membrane, and yet in which, at the same time, the most violent nephritis was going on. One of the children barely escaped with his life, and the other one died from total suppression of urine. In his experience he had found that it was exceedingly common for diphtheria to attack the kidneys.

As regards the character of the affection, he thought that all the best authorities now admitted that there were two distinct forms of it, viz.: the idiopathic and the secondary. The latter might occur whenever there was any inflammatory condition of the mucous membranes, and not infrequently supervened upon scarlatina, pertussis, and typhoid fever. If the disease occurred in the idiopathic forms, its local manifestations would also perfectly show themselves whenever there happened to be any irritated or inflamed surface at the time, as, for instance, from bronchial catarrh, or the action of a blister.

DR. WARD stated, in this connection, that during the late war, when scurvy broke out in the army before Port Hudson, he not infrequently noticed the appearance of diphtheritic patches upon the surfaces of scorbutic sores. In some cases the throat was affected

and in others entirely free from any diphtheritic appearances. Typhoid fever was also prevailing in the camp at the time.

Dr. Smith then went on to speak of the treatment of diphtheria, which, he said, must ever be a subject of the greatest interest and importance to practitioners, and especially at this time, when, as far as he could judge from the recent increase of cases in his part of the city, another epidemic of the disease seemed commencing. In the first place, he wished to state distinctly that he did not believe that we had any specific for diphtheria, in the sense that quinine is a specific for malaria, though a number of so-called specifics had been from time to time urged upon the attention of the profession. Among these might be mentioned bromine, cubebs, the sulpho-carbolate of soda, and, more recently, alcohol, as advocated by Dr. Chapman, of Brooklyn, in a paper read before the Kings County Medical Society. In a letter which Dr. Smith had just received from Dr. C., he stated that he believed alcohol was as much a specific for diphtheria as quinine is for intermittent. If called in during the first day or two of the attack, he thought he could save every case by the administration of alcohol in intoxicating doses. In the monograph which he read before the Kings County Society, he reported a series of cases treated in this way, in which there was but one death out of sixty-five, and in a series of cases observed subsequently, but one death out of forty. Dr. Smith thought that we were hardly justified in calling any remedy a specific, for the reason that the agents which had been claimed as such, and all of which seemed to have produced such admirable results, were entirely dissimilar in nature, and acted in an entirely different manner. In the last two or three years, he said, we had some six or eight *specifics* offered us; but, of the whole number of remedies proposed, he was inclined to think that alcohol approached more nearly to a specific than any other which we have at our command at present.

Dr. Smith then made the statement that the more he saw of diphtheria, the more he felt compelled to depart from Œrtel's views that it is primarily a local, and only secondarily a constitutional affection. He could not but regard it as a general disease, the germs or contagium of which are transmitted to the patient by means of inspired air. He therefore thought it was just as useless to look for any specific (that is, any remedy that will absolutely cure it or abort it) as for scarlatina, measles, typhoid fever, or any other such idiopathic disease; and could see no reason why we should be more successful in finding one for this affection than for any of the others. If another epidemic were about to begin in this city, he intended to give Dr. Chapman's plan of treatment a thorough trial, because, with his present views upon the subject, it seemed to him to offer the best chance of good results. His method was to administer a teaspoonful of brandy every hour or even every half-hour, to a child one or two years old. Under ordinary circumstances, of course, this would produce marked intoxication; but, on account of the depressing influence of the diphtheritic poison, he had found that children would tolerate an exceedingly large quantity of alcohol without any such effect being produced. Personally, he had employed the treatment in a number of cases during the past month, and he had had every reason to be greatly pleased with it. At the same time he would not give up such agents as iron and quinine; but he thought that we should now abandon all forms of local treatment which will cause irritation and an increased area of redness, for by their use, as has now been already demonstrated, we only increase the area of exudation. We should, therefore, employ only such local remedies as are not at all irritating to the mucous membrane. Disinfectants were particularly called for when there was a gangrenous state of the exudation, for the reason that the patient was constantly inhaling the delcterious gases which were given off by the sloughing membranes. He thought it utterly useless, however, to employ local measures for the purpose of aborting the disease, under the idea that it was at first merely of a local character; for he did not by any means believe that such was its nature.

Dr. Hadden stated that he frequently met in consultation gentlemen who believed that follicular tonsillitis, membranous croup, and what is more strictly regarded as true diphtheria, were all of the same character, and should all be treated by means of tonics and stimulants, and that he should like to have some information on the subject. In his experience, some cases of real diphtheria were well treated by means of alcohol; but what he considered as membranous croup was not well treated with alcohol.

Dr. Smith replied that he did not believe it possible at the present time, in this city, to make a differential diagnosis between membranous croup and diphtheria, on account of the comparative prevalence of the latter here. He regarded local measures (and particularly the steam-atomizer) of the greatest possible importance whenever the larynx was invaded by the deposit of false membranes. He was of the opinion, however, that croup and diphtheria were two entirely distinct affections. During the period from 1804 to 1857, when diphtheria was entirely unknown in this city, there were cases of membranous croup continually occurring.

Dr. W. T. White mentioned that up to 1857 there was no such disease as diphtheria recognized in New York, and Dr. Smith thought that it was a strong argument for the difference of the two affections, because croup was observed constantly while there was no diphtheria whatever. He had recently conversed with a physician from Onondaga County, who told him that he saw, on an average, about three cases of membranous croup each year, but that there was no diphtheria at all in that region of country. In his great work, which appeared many years ago, when diphtheria was practically unknown, Rokitansky had distinctly stated that every mucous membrane was liable to croupous exudation, a statement that was based on the observations derived from thirty thousand autopsies. At the present time, however, when a practitioner reports having seen more than four or five cases of membranous croup, it was certainly questionable whether they were not really cases of diphtheria.

Dr. C. E. Billington thought it was a matter of great practical importance to clearly distinguish diphtheria from follicular tonsillitis, and one in which there was a good deal of confusion in the minds of some practitioners. In follicular tonsillitis the patches covered portions of the tonsils, but the margins differed from those in diphtheria, in which they are red and angry-looking. In follicular tonsillitis the patches disappeared very rapidly, leaving little excavations, which are characteristic of this affection and seen in no other. The rapidity with which they disappeared was so constant that in any doubtful case the diagnosis could be made perfectly clear by waiting a day or two, and in several instances he had resorted to this plan. To decide definitely upon the appearances in any given case often required a good deal of practice, and experience was the only safe guide in making such a diagnosis. When one has seen something of both affections, how-

ever, it was usually not at all difficult to distinguish the definite membranes of diphtheria from the creamy and pulpaceous patches of follicular tonsillitis.

Dr. E. D. Hudson, Jr., asked Dr. Smith if, when diphtheria was epidemic, the type of any ordinary sore-throat was not liable to become changed into diphtheria; when the latter replied that follicular pharyngitis was not only more apt to become diphtheritic than simple pharyngitis, and not nearly so much so as the scarlatinal variety. He did not doubt, however, that almost any form of angina might become diphtheritic under certain circumstances. In regard to the differential diagnosis of diphtheria there were two affections liable to be mistaken for it, viz.: follicular tonsillitis and the formation of a fungoid or vegetable growth upon the inflamed mucous membrane of the fauces. The latter was easily distinguishable, because this growth could easily be scraped off from the surface where it appeared. In follicular pharyngitis the white substance, as he had noticed it, appeared around the different follicles. If a patch were a quarter or half an inch in diameter, and penetrated the mucous membrane, he would be disposed to believe that it was a case of true diphtheria. So in ordinary croup, the exudation did not penetrate the mucous membrane, while, as had just been stated, this was always the case in diphtheria. There was also a line of demarcation. Still, in each affection the membranes were fibrinous, with epithelial cells between their meshes, and he did not believe it possible to make a differential diagnosis between them at the bedside.

Dr. Hadden—"Then you would at once put the patient upon alcohol and other supporting treatment, whether you thought the case one of croup or one of diphtheria?"

Dr. Smith—"Undoubtedly, though I should also attend carefully to the local treatment (especially the use of steam-inhalations) as of the very greatest service."

Dr. Billington said that it was now granted by the best authorities (whatever might be their theories as to the nature of diphtheria) that most of the cases of croup occurring at the present time are diphtheritic. He had seen cases of diphtheria in which the symptoms were very severe, and yet the amount of exudation apparently very slight; but in such cases he believed that there was always a good deal of membrane in such positions as to be invisible, as, for instance, upon the posterior surface of the tonsils and the soft palate. In several instances where he had suspected this to be the case, he had succeeded in washing out considerable quantities of membrane by thoroughly syringing the parts. He was in the habit of using copious injections of tepid salt water, which was not at all irritating to the surfaces.

The fact that diphtheritic exudation occurs in other affections, and supervenes upon wounds or ulcers, was suggestive to him that the contagium of the disease (whether chemical or organic in its nature) acted locally. It was well known that absorption was favored by a denudation of the epithelium, and it seemed to him that the point where the contagium was deposited was the local origin of a constitutional disease.

Dr. Smith differed from Dr. Billington in this matter. He said that he understood that now, contrary to the former teaching, the best authorities held that, when a chancre made its appearance, the constitution was already affected with syphilis. So in vaccination, when the characteristic vesicle appeared, the system was under the influence of the vaccine poison, or ferment, or whatever it might be called. It could not be doubted that, in a certain proportion of cases at least, the diphtheritic poison was conveyed into the system by inhalation, and he was therefore of the opinion that, when the membranes appear in the throat, the general system is already affected.

Dr. Billington thought there was one point in which the analogy between small-pox, or vaccinia, and diphtheria, instituted by Dr. Smith, did not hold good, and that was this: in small-pox it was impossible to cut the disease short, while he believed this was possible in diphtheria by the appropriate use of local measures. He was confident that he had been able thus to shorten and actually cure a great many cases, though, of course, others might not agree with him in this; and he urged upon the profession the more careful recording of the grounds for diagnosis and the history of all cases of diphtheria.

Dr. Ward mentioned another point in which he thought Dr. Smith's analogy was defective. The having had syphilis or small-pox once was supposed to be protective against future attacks, but this was not the case with diphtheria.

Dr. Smith replied that it was possible to have erysipelas twenty times, and yet it was a constitutional disease. Also, like diphtheria, it had no fixed period of duration. He had seen instances of scarlatina get well in three or four days, and sometimes in such cases he was on the point of reversing his opinion, under the idea that he had made a mistake in the affection, when the occurrence of one of the well-known sequelæ of this disease showed that the diagnosis had been correct.

After some remarks on the clinical history of diphtheria, Dr. Hadden gave a sketch of the plan of treatment which he is now in the habit of employing. If he saw the case early, he said, he usually produced free purgation by means of calomel, after which he relied simply on local measures. He had given up the employment of quinine entirely (until the patient had become convalescent), as he now regarded it as worse than useless. He had formerly employed alcohol freely, but as his patients frequently died while taking it, he had given that up also. His great reliance was upon keeping the affected parts thoroughly washed by means of a Davidson syringe, the injection which he usually employed being a mixture containing fifteen or twenty drops of bromine to the pint of water. He also depended a good deal on the local application of persulphate of iron in glycerine (a half-drachm or drachm to the ounce). If there was any phagedæna, he was in the habit of brushing the parts with Prof. Wm. H. Thomson's solution of bromine. Since adopting this plan of treatment, he was happy to say that he had met with highly satisfactory results in his diphtheria cases. He had had two recoveries from membranous laryngitis after tracheotomy, the second of the two cases being, apparently, an exceedingly unfavorable one. In this case he had injected iron and glycerine (of the strength of a drachm to the ounce) through the tube. He had used the application as freely in this manner as upon the tonsils, and it had the effect of dislodging the membrane, which had extended below the seat of the operation. In another case of tracheotomy performed the same day, in which no injections were made through the tube, the patient died.

Dr. Hudson thought it possible that Dr. Hadden's apparent success in diphtheria, by the method which he had detailed, might really be due to the season. It was well known that, during the last year or so, diphtheria had not been nearly so fatal in this city as for three or four years previously. Dr. Thomson at one time met with quite a long series of uninterrupted successes with his bromine treatment; but suddenly

he lost three or four cases almost at once, notwithstanding its employment. He was in favor of employing both local and constitutional remedies, and thought the practitioner who neglected either class laid himself open to criticism. Among the former he included all the various disinfectants which have been found of service. He was also inclined to think that in some instances the disease might be aborted, and then related a case by way of illustration. It was that of an adult living on Seventh Avenue, who had a violent chill and marked constitutional disturbance, and the excessive engorgement of whose throat led him to expect a case of diphtheria of the most serious character. Under the use of heroic and often repeated doses of quinine, however, and the constant application of the cold spray to the fauces, all the symptoms, both local and general, gradually subsided.

DR. RANDALL stated that he was the family physician in attendance upon the cases which had been alluded to as having died under the care of Dr. Thomson. There were eight children in the family, and they all had diphtheria. In the first of the cases the exudation extended to the larynx, and the child died from suffocation. In the second case the disease was of a much more violent type, and Dr. W. T. White was called in consultation. The treatment consisted of chlorate of potassium, glycerine, and carbolic acid. Under its use the exudation seemed to break down in flakes; but it afterwards reappeared in the larynx, and the child died. The fourth case was the most violent of all. On returning from school one day, the child had a chill, which was followed by high fever; the temperature running up to 104 or 105 degrees. In twelve or fourteen hours the fever suddenly abated, but the child lived only thirty-six hours after the commencement of the attack. An enormous slough had formed within twenty-four hours from the initial chill. Six of the eight children died: two from asphyxia (on account of the exudation in the larynx), and four from exhaustion. Three of them had died when Dr. Thomson was called in consultation. He proposed an entire change in the treatment, and, in accordance with his advice, all the remaining children were brought under the influence of bromine. The bromine treatment was carried out thoroughly, and he himself made the applications to the fauces of the children; but, notwithstanding, three more of the little patients died. Thus, out of four children upon whom the chlorate of potassium treatment was employed, three died, and out of four upon whom the bromine treatment was employed, three died. The father, mother, and grandmother also had the disease, but recovered.

DR. SMITH inquired if the urine of these children was examined, and DR. RANDALL replied that he thought it had not, though there was nothing abnormal about its appearance in any of the cases.

DR. SMITH then stated that in malignant cases albuminuria might be found as early as the close of the first day, though the urine was perfectly normal in appearance, having none of that smoky look which is so common in scarlatinal albuminuria. It was now his practice to examine the urine in every case of diphtheria that came under his care. In his experience, diphtheritic nephritis was an exceedingly frequent complication, and he regarded it as much more grave than the scarlatinal nephritis. Dr. Chapman's idea was that the early and free use of alcohol would prevent nephritis and other serious complications or consequences, and if it could be proved that this was really the case, the treatment would certainly soon be held in the highest estimation.

DR. RANDALL remarked, in conclusion, that after the unfortunate series of cases which had been described, he continued to use the chlorate of potassium and glycerine, with brandy-punch given freely, and that he had not lost more than two or three cases out of quite a large number, many of which were quite as severe as some of those in the family in which such frightful mortality occurred.

SURGICAL SECTION.

Stated Meeting, March 12, 1878.

DR. STEPHEN SMITH, CHAIRMAN.

REPAIR AFTER EXSECTION OF THE HIP-JOINT.

DR. LEWIS A. SAYRE gave, as an illustration of the repair which might take place after exsection of the hip-joint, a detailed history of the case of Rosa Mullins, who was operated upon in Bellevue Hospital, September 29, 1875. The patient died March 4, 1878. The report consisted of the history of the case and notes as made in his private case book, also as written in the hospital records, was accompanied by a post-mortem report as dictated by Dr. E. G. Janeway, and a report of the microscopical examination as made by Dr. C. Heitzman. The morbid specimen accompanied the paper, and exhibited a most remarkable amount of repair which had occurred since the operation. It was the case to which allusion had been made by Dr. C. Fayette Taylor, in a paper read before the New York Medical Journal Association, February 15, 1878, and published in abstract in THE MEDICAL RECORD for March 2, 1878. From the hospital record, it was shown that, on October 30, 1875, the incision made in the operation was closed, and that the child could walk by the aid of a wheel-crutch. At that time there was a small open sinus on the posterior aspect of the hip, and that sinus remained open during life, but, at autopsy, it was found that it did not communicate with dead or diseased bone. The repair which had taken place gave to the upper extremity of the femur a most striking resemblance to the great trochanter neck and head of the healthy femur upon the opposite side. There was considerable motion about what might be called the newly-formed head, and the microscopical examination demonstrated the presence of newly-formed cartilage. From May 19, 1876, until November, 1877, Dr. Sayre did not see the child, and from the hospital record it appeared that no means were employed with the view of maintaining extension, from the first date up to the time the child died, and yet the lower extremities were of equal length. The liver, spleen, kidneys, and intestines had undergone waxy degeneration, and there was angular curvature of the spine, although there was no carious bone present. The liver was enlarged, and there was evidence of waxy kidney at the time the operation was performed. Notwithstanding the unfavorable condition of the child, it seemed very evident that the operation had been followed by most extraordinary repair, and in no sense could it be said that the child died because of its performance. On the contrary, Dr. Sayre believed that the autopsy proved that the operation was not only justifiable, but demanded even in cases in which it was evident that waxy degeneration of internal organs had already taken place.

DR. C. FAYETTE TAYLOR remarked that he thought Dr. Sayre did not quite appreciate the object which was in view, when, in his paper, he referred to the case of Rosa Mullins, which had just been reported. Dr. Taylor had taken it for granted that disease had been reproduced at the seat of the operation, and he

did not see how any other conclusion could have been reached in absence of post-mortem examination, which at the time he read his paper had not been made. It seemed that the inference that the sinuses reached the joint was a mistaken one, as the specimen demonstrated. The specimen exhibited a most remarkable amount of repair. But what right had surgeons to assume that such wonderful reparative effort could not take place under other forms of treatment as well as after excision. After admitting all that was claimed for excision, Dr. Taylor still thought that a better record could be shown by more conservative methods.

The only point, however, which he wished to make in his paper, was that the operation of excision was unreliable with regard to ultimate results—that is, results a long time after the operation had been performed, and even the sinuses closed, at which time they were commonly reported as cured. He did not question the veracity of Dr. Sayre's report, but he simply doubted the reliability of the operation with reference to ultimate results.

DR. SAYRE remarked that if disease could be produced in healthy bone, it could be much more easily developed in newly-formed tissue; but that fact did not in any way invalidate the claim that patients suffering from hip-joint disease were cured by the operation of exsection. Of the seventy cases on which he had operated, twenty-three were perfectly well, recovery had taken place with less than one inch of shortening, and there was more or less of motion. In two cases, recovery had taken place with more than the normal amount of motion. In all these cases he regarded it as evident that the disease must be developed anew, if the patient again suffered from morbus coxarius.

Dr. Sayre then reviewed the statistics given by Dr. Gibney, and published in THE MEDICAL RECORD for March 2, 1878, and believed that an analysis of his own cases showed a marked result in favor of the operation, as compared with the results obtained by leaving the cases to nature.

DR. STEPHEN SMITH raised the following question: In a case like the one reported, one of advanced hip-joint disease, with waxy degeneration of internal organs—one which had received no treatment, and, if left to itself, would probably not progress towards recovery—which would be the best method of treatment, excision or treatment by means of extension, liberating pus, etc.?

DR. SAYRE believed that, if dead bone was present, exsection, supplemented by proper mechanical treatment, was unquestionably the most proper method.

DR. SMITH remarked that the dead bone would come away of itself after a time, and that the question was yet left, which is the shortest route to a cure?

DR. SAYRE believed that the history of the case, and the specimen, showed that the operation was the best method of treatment. If the spine and hip had been properly treated, the general condition of the child would have been improved. No repair at the hip could have taken place until the dead bone was removed, and its removal could be effected much quicker with the saw than by leaving it to the slow process of nature.

DR. POST asked, would not the disease of the liver and kidneys probably have been prevented had the operation been performed at an earlier date?

DR. SAYRE replied that, undoubtedly, it would have been prevented.

DR. POST remarked that, with regard to diseases of the bones, there were two points of practical importance:

1. Free outlet should be secured for all purulent discharge; and

2. Every source of irritation, which might arise from carious or necrosed bone should be removed.

DR. TAYLOR remarked that he was not sufficiently satisfied that a case, such as reported by Dr. Sayre, could not be treated successfully without excision. He had treated a case which was in as bad condition as any case could be—treated it by extension mainly, and the patient had recovered as rapidly as recovery had followed excision. Whether more recovered under excision than under mechanical treatment, or more recovered under mechanical treatment than under excision, was a fair question for discussion; but he regarded it as hardly fair to assume that excision was the best method of treatment, in absence of a comparison with the results obtained by other methods of treatment. There was no question that cases occurred similar to that reported by Dr. Sayre; that was not the question at issue; but the question was, were all the facts relating to excision yet developed—were there not other facts which would materially modify conclusions that had been made regarding the value of the operation?

Dr. Taylor then presented the ratio of mortality that had occurred in ninety-four cases of morbus coxarius, which had received mechanical treatment and had been under continuous observation. Of this number, three had died of the disease, or the ratio of mortality was 3½ per cent. In a certain sense, those were selected because the doctor would not undertake the treatment of any case unless he could have it exclusively under his control. The representation, therefore, as a matter of course, was better than it would have been had it been based upon all the cases which applied for treatment. Of the ninety-four cases, twenty-five had abscess, either intra- or extra-capsular, or both. Of these suppurating cases, two, or 8 per cent., died.

DR. SAYRE remarked that, from one of the facts just stated by Dr. Taylor, his statistics were worthless, for it was not known what became of the cases which were seen, and which did not remain under treatment.

DR. TAYLOR remarked that he had no right to report except upon the cases which had remained under observation. The statistics were good as far as they extended. He did not regard the case as cured unless the patient was discharged with as good a joint as could be obtained.

DR. JUDSON remarked that Dr. Taylor's statistics were interesting mainly with reference to those cases which he classed under abscess. It would be interesting to know what proportion of the twenty-five cases were proper ones for exsection. Dr. Judson was of the opinion that a patient with a suppurating joint—one which would be regarded as proper for exsection, if free discharge of pus could be given, would stand as good, if not better, chance of getting well with a long and useful limb, by the use of mechanical apparatus as by exsection, which was an operation unquestionably followed by shortening, except in extraordinary cases.

DR. POST remarked that necrosis or caries of the bone must be added to suppuration, to place the joint in the most unfavorable condition for recovery to take place.

DR. TAYLOR remarked that even some of those cases recovered without any treatment.

DR. SAYRE said that he had seen many cases of suppurating joint recover without exsection.

DR. SMITH asked Dr. Taylor if in such cases recovery was not usually with anchylosis.

Dr. Taylor replied that anchylosis did not necessarily result; after the head of the bone was destroyed, they were more apt to recover with motion.

Dr. Gibney referred to a case in which exsection was performed six months after the opening of the abscess. At the end of three years there was still active suppuration.

Dr. Sayre remarked that the dead bone was not all removed, and as a matter of course suppuration would be continued as long as the dead bone remained. If dead bone was so situated that it could not be removed, the operation of exsection was not followed by any special benefit.

At a late hour the Section adjourned.

OBSTETRIC SECTION.

Stated Meeting, March 18, 1878.

Dr. S. Caro, Chairman.

HEART-BURN, WATER-BRASH, AND VOMITING DURING PREGNANCY.

Dr. Sell referred to a case which was effectually relieved, after all ordinary treatment had failed, by the use of the co. elixir of helonias, or, as he used it, in the form of pills composed of helonias, caulophyllin, and viburnin. He regarded the remedy as a uterine tonic and sedative.

Dr. Hall said he had used oxalate of cerium for the same purpose, and had become convinced that the best results were to be obtained by the use of large doses.

FATAL HEMORRHAGE FROM THE UMBILICUS.

Dr. Downs reported a case in which fatal hemorrhage occurred from the navel of a child ten days old. The cord dropped off on the fifth day; the hemorrhage began on the tenth day. Dr. Downs saw the case in consultation; used Monsel's solution, and the hemorrhage was arrested; but the child was exsanguinated, and died within a few hours. The question arose, could not the blood-vessels have been ligated? At one time the attending physician was obliged to use pressure with the finger, in order to check the bleeding, the blood welling up from the navel.

Dr. Post thought that perhaps the vessels might have been ligated, or that the actual cautery could have been employed.

Dr. Caro related a case in which he arrested bleeding from the navel by lifting it up with a tenaculum, and embracing the whole substance with a piece of tape, which was tied tightly. The mother was suffering from chronic malaria at the time the child was born, and the child's liver was hypertrophied. The liver rapidly diminished in size after the bleeding, and Dr. Caro was of the opinion that the hemorrhage from the navel saved the child's life. The tape was allowed to remain eight days.

QUINSY SORE-THROAT ABORTED BY OPIUM.

Dr. J. C. Peters referred to a case in which suppurative tonsillitis had occurred a number of times, each time resisting all efforts to cut the disease short, and in which latterly he had arrested the disease by the use of opium. He had administered Magendie's solution of morphine, in doses of five drops, repeated every three or four hours.

Dr. Carpenter had noticed in a few cases, that, after tonsillitis had advanced to suppuration three or four times, the patient occasionally suffered from all the premonitory symptoms of quinsy, but without special treatment suppuration did not occur. Might it not be that, in certain cases, a kind of tolerance was developed, and that in Dr. Peters' case the apparent abortion was simply a feature in the natural history of the disease, rather than the result of any method of treatment?

Dr. Peters suggested that repeated attacks of suppurative tonsillitis might give rise to more or less fibrous induration, thus diminishing the liability to the development of suppuration.

Dr. Hall referred to carbonic acid water as a gargle for the arrest of threatened suppuration of the tonsils.

Dr. O'Sullivan believed he had aborted cases of quinsy sore-throat by the use of croton oil and turpentine externally, and nitrate of silver as an internal local application.

Dr. F. V. White related a case which seemed to militate against the idea that repeated attacks of suppurative tonsillitis were followed by a tolerance of the disease.

Dr. Downs had been in the habit of resorting to free scarification as a means for aborting tonsillitis.

FOLLICULAR PHARYNGITIS AND TONSILLITIS.

Dr. J. Lewis Smith referred to cases of this affection, and remarked that, from their history, the thought had arisen in his mind that perhaps the disease was contagious. He made inquiry, therefore, with reference to that point. He had noticed that some writers spoke of "herpetic inflammation of the throat," and he made inquiry of Dr. Piffard as to what was understood by the term.

Dr. Piffard replied that he knew nothing of herpetic inflammation of the throat; that is, a disease which was analogous to any herpetic eruption upon the skin. It might mean an eczematous condition, similar to an eczematous condition of the skin; or it might mean little vesicles which sometimes appeared in the mouth, and when they ruptured a circumscribed erosion remained.

Dr. O'Sullivan referred to a family in which six children suffered from follicular tonsillitis and pharyngitis within two weeks. He had not, however, thought that it was contagious.

Dr. Peters remarked that he had been quite familiar with the affection during the last thirty years. Thirty years ago it was very abundant, and was attended by marked prostration. He had not entertained the idea that it was a contagious disease.

Dr. Post had seen considerable of the disease, but did not regard it as a contagious affection.

Dr. Caro related the history of three cases occurring in one family, and believed them to be due to contamination of the house by sewer-gas. The plumbing was found deficient. During the winter he had seen a great deal of follicular tonsillitis between Madison and Fourth Avenues, and 50th and 63d Streets, a territory on which there was a great deal of made land and deficient drainage.

SCARLATINA ANGINOSA AND DIPHTHERIA.

Dr. Peters referred to scarlatina anginosa, which appeared in great abundance some twenty-five years ago, and asked whether there was any difference between it and scarlet fever complicated with diphtheria of the present day. He was not able to recognize any difference, and did not believe there was any diphtheria in such cases, but that the condition of the throat was a part of the scarlet fever.

Dr. J. Lewis Smith believed that there were cases in which the patient had scarlet fever at first, and per-

haps at the end of a week or more true diphtheria supervened, and the case went on with diphtheria complicating the scarlet fever.

The Section then adjourned.

Correspondence.

THYMOL AS AN ANTISEPTIC.

To the Editor of The Medical Record.

Dear Sir—Permit me to call the attention of your readers to the use of thymol as a substitute for carbolic acid in the antiseptic treatment of wounds. The injurious effects of the latter upon instruments, and its irritant and anæsthetic effects upon the hands of the surgeon, have prevented some from attempting, and others from properly carrying out this method. Thymol has not these disadvantages, and is, moreover, to be preferred to carbolic acid from the fact that the details of the dressing are less complex, the secretions less in quantity, the cost not so great (owing to longer retention of the dressings—although the price of the drug is considerably higher), and the duration of the healing process shorter. But one solution is necessary for all purposes, spray, instruments, sponges, etc. This is of the strength of 1 part thymol to 1,000 parts water, with the addition of a small quantity of alcohol and glycerine to increase the solubility of the thymol. The formula is

Thymol,*	1.0 grammes	.....	or gr. xvss.
Alcohol,	10.0 "	.....	" ʒ iij.
Glycerine,	20.0 "	.....	" ʒ ss.
Aquæ,	1000.0 "	.....	" ʒ xxxiv.

This makes a clear solution of agreeable odor. It does not irritate the wound surface, and hence the "protective silk" may be dispensed with. The gauze is made in the same way as the carbolized material, but spermaceti is substituted for paraffine, since the latter is believed to cause the erythema and occasional eczema of the skin about wounds. The proportions are 1,000 parts of gauze, 500 of spermaceti, 50 of resin, 16 of thymol.

The method of using this dressing is the same as for the carbolic acid. The carbolized cat-gut is retained, and rubber drainage-tubes still preferred.

My source of information in this matter is an article by Ranke ("Ueber das Thymol und seine Benutzung bei der antiseptischen Behandlung der Wunden") in the *Samm. klin. Vorträge* (No. 128), which contains an elaborate account of the chemical properties of the drug, with directions for using it, and a table of cases in which it has been employed. The author states that it is in every respect to be preferred to carbolic acid, and that since the first of this year it has almost entirely replaced the latter in the clinic of Professor Volkmann, at Halle. Fifty-nine operative cases are cited, chiefly of minor importance, but including several excisions of the breast, amputations of the foot and leg, excisions of the elbow, and kelotomies. In only two was there formation of pus. Olshausen has used the dressing in three ovariotomies without subsequent reaction.

I have used this material in only one or two minor cases, but can testify to its unirritating character and agreeable odor. Some excellent gauze has been prepared by Messrs. Caswell & Hazard.

Respectfully,

Wm. T. Bull, M.D.

26 West 33d Street, April 6, 1878.

* In getting the equivalents of the measures of the metric in this formula there is an excess of 1-6000 gr. of thymol an ʒ iss of water.

Asylum Abuses.—Report of the committee appointed by the Medico-Legal Society to memorialize the Legislature on the subject of Dr. Spitzka's paper, read before the Society February 6, 1878:

The committee appointed to memorialize the Legislature on the subject of Dr. Spitzka's paper on asylum abuses, read before the Society at its meeting February 6, 1878, respectfully report: That they met and duly considered the subject, and, as the result of their deliberations, forwarded to the Hon. I. I. Hayes a memorial, of which the following is a copy:

To the Honorable the Senate and Assembly of the State of New York.

The undersigned, a committee of the Medico-Legal Society of the city of New York, respectfully ask your honorable bodies to institute an investigation into the condition and management of the lunatic asylums of this State.

The committee has great reason to believe that the unfortunate inmates are, many of them, treated in a manner which is disgraceful to civilization, cruel, and barbarous, and not in accord with the present advanced state of medical science. In support of these allegations, which are made with all due solemnity, the committee not only (as directed by the Society it represents) appended a copy of a paper read by Dr. E. C. Spitzka before the Society at its meeting on the 6th inst., but it affirms its readiness to substantiate them by the testimony of experts in psychological medicine in all parts of the State and country, as well as by the declarations of eminent foreign alienists, and by comparison with like institutions in Great Britain, France, and Germany.

The committee asks the attention of your honorable bodies to the whole system by which the insane asylums of this State are managed, and especially to the State Lunatic Asylum at Utica, an institution against which grave charges have been made by responsible and competent persons.

The committee, therefore, for the accomplishment of the objects in view, respectfully requests your honorable bodies to appoint a Joint Committee of Inquiry, with power to take testimony, or to proceed in such other manner as to your honorable bodies may seem best.

And your memorialists, as in duty bound, will ever pray, etc.,

JOHN C. HAMMOND, M.D.
WILLIAM A. HAMMOND, M.D.
D. S. RIDDLE.
JACOB F. MILLER.
EDWARD C. SPITZKA.

NEW YORK, March 18, 1878.

This memorial was introduced into the Assembly, accompanied by a resolution providing in the fullest manner for the appointment of a committee, with power to investigate the insane asylums of this State. There is reason to believe that the resolution will be considered by the Assembly within a short time.

The committee, however, is of the opinion that the efforts of the Medico-Legal Society should not stop here, and therefore begs leave to offer the following resolution:

Resolved, That a committee of six members, taken equally from the medical and legal professions, be appointed to take into consideration the subject of mechanical restraint in lunatic asylums, and to report to the Society what further measures are necessary to secure its abolition within the limits of the State of New York.

The committee would also recommend the passage of the following resolution:

Resolved, That the thanks of the Medico-Legal Society be tendered to the Hon. I. I. Hayes, for the promptness and thoroughness with which he acted in introducing into the Assembly a measure tending to ameliorate the condition of the unfortunate patients confined in the lunatic asylums of this State.

The report was accepted, and the resolutions were adopted.

The committee appointed under the first resolution was composed of Dr. William A. Hammond, Clarence W. Seward, Esq., Dr. E. C. Harwood, T. B. Wakeman, Esq., Dr. Thos. C. Finnell, and Cephas Brainerd, Esq.

THE BROWN-SÉQUARD TREATMENT IN EPILEPSY.—The typographical error which occurred in the *Bost. Med. and Surg. Journal*, in one of the principal ingredients of the formula, and occasioned our being led astray, has been corrected by Dr. Ayer. It should read as follows:

℞. Sodii bromidi,
Potassii bromidi,
Ammonii bromidi..... ää ʒ iij.
Potassii iodidi,
Ammonii iodidi..... ää ʒ iss.
Ammoniæ sesquicarb..... ʒ i.
Tinc. calumbæ..... f ℥ iss.
Aquæ destillat..... ad f ℥ viij.
M.

Full dose: one and a half drachms before each meal, and three drachms at bed-time.

This is the special formula that Dr. Ayer mainly relied upon, though we are informed by Mr. Neergaard, of this city, that Dr. Brown Séquard modified it in a good many instances.

DEATH OF PROF. FRANCIS GURNEY SMITH, M.D., OF PHILADELPHIA.—Prof. Francis Gurney Smith, M.D., of the University of Pennsylvania, died at his residence in Philadelphia last Saturday. Dr. Smith was born in Philadelphia, March 8, 1818, and was the fifth son of Francis G. Smith, a prominent merchant. He obtained both his academic and medical education in the University of Pennsylvania, receiving his degree of Doctor of Medicine in 1840. For about a year after graduating he was one of the physicians of the Department of the Insane of the Pennsylvania Hospital. In 1842, he was elected Lecturer on Physiology by the Philadelphia Medical Association. In 1863 he was elected Professor of the Institutes of Medicine in the University, and filled the chair of that professorship until his death. For six years, commencing in 1859, he was one of the attending physicians of the Pennsylvania Hospital. Prof. Smith is well known in medical literature as one of the compilers of the text-book, the *Compendium of Medicine*, which has passed through numerous editions; as one of the editors, for nine years, of the *Philadelphia Medical Examiner*; as the author of frequent contributions to professional periodicals; as the editor of American editions of Carpenter's and Marshall's works on physiology, etc., and as the first American translator of Barth & Rogers' *Manual of Auscultation and Percussion*.

COMPLIMENTARY DINNER TO MR. REGINALD HARRISON, F.R.C.S., OF LIVERPOOL, ENG.—During the visit of this distinguished gentleman to this city, he has been the recipient of many attentions from his medical friends, who have vied with each other in doing him honor. On Tuesday evening last, Dr. L. A. Sayre gave him a dinner at the New York Club. The particular compliment of the occasion was centred in the representative character of the gentlemen present. Allowing our natural modesty to make a single exception, it is safe to say that rarely on similar occasions and for a small company has more distinguished medical gentlemen been gathered together. The following sat down at the festive board: Dr. Fordyce Barker, Judge John R. Brady, Dr. R. Cauldwell, late surgeon of the Russia; Drs. Austin Flint, J. W. S. Gouley, Samuel W. Gross, of Philadelphia; Montrose A. Pallen, John C. Peters, Alfred C. Post, W. M. Polk, D. B. St. John Roosa, L. A. Sayre and his sons, Drs. Charles H. H. and Louis H., Geo. F. Shrady, Isaac E. Taylor, T. Gaillard Thomas, and William H. Van Buren. Drs. James R. Wood, Austin Flint, Jr., and Drs. Pancoast and Samuel D. Gross, of Philadelphia, also invited, were unable to be present, and sent letters of regret.

Numerous toasts were drank, and, as might have been anticipated, many admirable speeches were made. Mr. Harrison was entertained at luncheon on Wednesday by Dr. J. W. S. Gouley, at the residence of the latter, and in company with several distinguished medical gentlemen.

CLAUDE BERNARD.—A monument to Claude Bernard is to be raised in Paris by public subscription. The *Société de Biologie*, of which he was one of the founders, and for many years the President, has taken the initiative in the subscription. The list will be headed by the Minister of Public Instruction.

M. HIRTZ.—The death is reported of M. Hirtz, formerly Clinical Professor in the Faculty of Strasburg. He was the author of numerous and valuable contributions to medical science, his studies on digitalis, veratrine, and the antimonial preparations being particularly valuable. M. Hirtz was one of those who refused to remain in Strasburg after the city became part of Germany, preferring to lose his home and his professorship rather than change his nationality.

ADULTERATION OF FLOUR.—A miller in Einbungen, Germany, was condemned last month to three months' imprisonment, for mixing gypsum with his flour. One specimen of his flour contained 8.7 per cent., and another 13.7 per cent. of gypsum.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

SURGERY

THE PRINCIPLES AND PRACTICE.

By FRANK HASTINGS HAMILTON, M.D., LL.D.,

Professor of the practice of Surgery with Operations, and of Clinical Surgery in Bellevue Hospital Medical College; Visiting Surgeon to Bellevue Hospital; Consulting Surgeon to the Bureau of Surgical and Medical Relief for the Out-Door Poor at Bellevue Hospital; to the Central Dispensary, and to the Hospital for the Ruptured and Cripplet; Fellow of the New York Academy of Medicine, etc.

In one royal octavo volume of about 1,000 pages, illustrated by 467 Engravings on wood.

Price, in extra muslin, $7.00; or in leather, $8.00.

NOTICES OF THE PRESS.

"Has evidently been prepared with the greatest care, both on the part of the author and his publishers; and as a text-book for the students, it reflects the highest credit upon its well-known and gifted writer. As a text-book for the student, or one of reference for the busy practitioner, it undoubtedly is one of the best and *most modern* that has yet appeared."—*The Medical Record.*

"A valuable addition to our list of text-books, an excellent work of reference, a credit to our professional literature."—*New York Medical Journal.*

"It will be found an excellent and common-sense volume."—*London Medical Times and Gazette.*

"This is one of the best text-books upon Surgery which we have ever seen, and we recommend it highly to the profession."—*Chicago Medical Examiner.*

"Prof. Hamilton's latest work is one that will add to his already high reputation. . . . . It is full of valuable practical suggestions, and directions."—*Am. Journal of Medical Science.*

"American in plan, scientific in method, written in clear, concise, classical English, Prof. Hamilton's Surgery is a noble legacy to the medical student, an honor to the profession, and an ornament to our native tongue."—*Detroit Review of Medicine.*

A SYSTEM OF SURGERY,

THEORETICAL AND PRACTICAL,

IN TREATISES BY VARIOUS AUTHORS.

Edited by T. HOLMES, M.D.,

Surgeon and Lecturer on Surgery, St. George's Hospital, and Surgeon-in-Chief to the Metropolitan Police.

With numerous Woodcuts, Lithographs, and Chromo-Lithographs—in all four hundred and seventy-two illustrations—in five volumes octavo.

Price, in muslin binding, $45; or, in half turkey morocco, gilt top, $50.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York.

Medal of Excellence Awarded at the American Institute Fair, 1877.

FOR DRESSING WOUNDS.

BORATED COTTON for TAMPONS.

"Its therapeutic value is quite decided."—NEW REMEDIES.

ANTISEPTIC GAUZE.

FOR SALE AT THE PRINCIPAL DRUG STORES AND MANUFACTURERS OF SURGICAL INSTRUMENTS.

For Samples, address **C. AM ENDE, Hoboken. N. J.**

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HÆMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

NOW READY.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS

By SIDNEY RINGER, M.D.,

Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price, - - - - - $4.50

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adult."—DR. DESSEAU *in Medical Record, July* 28, 1877.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

NEW HYPODERMIC SYRINGES.

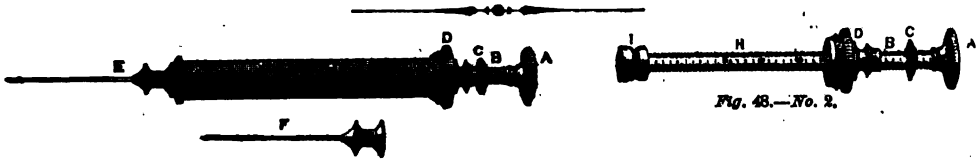

Fig. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the gradation of doses.

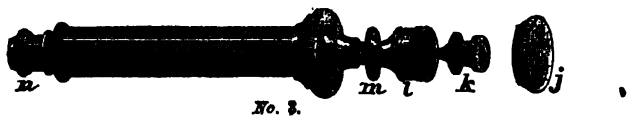
No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, **$4.00.** No. 2, **$4.50.** Postage, .03.
" No. 3, **3.00.** No. 4, **4.00.** " .02.



No. 2.

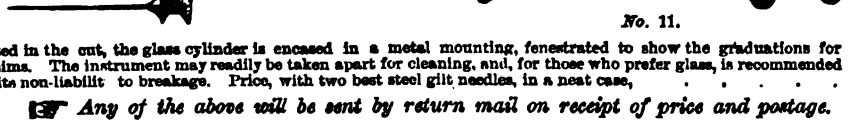
These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case,	$3.00	.02

No. 9.

		Postage.
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, two best steel gilt needles, in neat case,	$3.00	.02
No. 7 or No. 9, with two steel unplated needles, either,	2.50	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case,	12.00	.02
No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).		



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and, for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case, **$3.50** Postage. .02

☞ *Any of the above will be sent by return mail on receipt of price and postage.*

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new **Illustrated Catalogue of Surgical Instruments,** also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone pooducers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE****, and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

MALTINE **WITH HOPS.**

MALTINE, **FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

MALTINE **WITH PHOS. IRON AND QUINIA:**
A powerful general and nutritive tonic.

MALTINE **WITH PHOS. IRON, QUINIA AND STRYCHNIA:**
A powerful nutritive, general and nervous tonic.

MALTINE **WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

MALTINE **WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

MALTINE **WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

MALTINE **WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

MALTINE **WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

MALTINE **WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

MALTINE **WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ½ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

REED & CARNRICK, Manufacturing Pharmacists,

196 and 198 Fulton Street, New York.

B. Keith & Co.,

MANUFACTURERS OF

— PURE —

CONCENTRATED MEDICINES

Concentrated Tinctures, &c.

The powders are put up in bottles of one ounce, avoirdupois, and securely sealed to protect them from the action of the atmosphere.

We will furnish gratis, on application, a copy of our *"Revised and Enlarged Manual of the Active Principles of Indigenous and Foreign Medicinal Plants,"* containing short accounts of each preparation, with properties, uses, doses, etc., also price list. Address all communications to

B. KEITH & CO., 41 Liberty St., N.Y.

Dr. Garratt's Constant Electric Disks,

That any person may apply and wear with comfort for relief of local *pains* and *weakness;* for old Rheumatic and Neuralgic pains, coldness and stiffness. It is also remarkable for its constant power to help Weak Lungs, Heart, Stomach, Kidneys, Sluggish Liver, Lame Back, and other ills. *While worn*, by night or day, this flexible pad is self-charging and applies a fine, constant galvanism that wonderfully cures nervous ills. For the price and purpose, it has no equal. So say physicians, druggists, and those now using this improved electric. Large Disk, $2.50; Children's Disk, $1.00; Long Disk, with straps for the body, $3.50; Do. for large body, $5. Can be sent by mail on receipt of price, by GARRATT & Co., 6 Hamilton Place, Boston, Mass.

WHITE'S SACCHARATED PEPSIN

(PEPSIN PORCI).

This Pepsin is prepared with the greatest care, and can be relied upon by Physicians who desire to obtain satisfactory results. It exceeds the standard of the label, and will be found uniform and to equal several pepsins now on the market, which are sold at a much higher price. SOLE AGENT FOR THE UNITED STATES,

E. G. KENT, 29 Liberty St., New York,

Of whom samples may be had and to whom all communications must be addressed.

CORRESPONDENCE SOLICITED.

Works on Materia Medica and Therapeutics.

THE ESSENTIALS OF MATERIA MEDICA AND THERAPEUTICS.

BY ALFRED BARING GARROD, M.D., F.R.S., Fellow of the Royal College of Physicians, etc., etc.

Second edition, revised and much enlarged. One handsome 8vo volume, extra muslin. Price $4.00.

"The work of Dr. Garrod supplies a want that has long been felt on this side of the Atlantic. The editor has confined himself to supplying a few of the omissions of Dr. Garrod, and to indicating where a difference exists in the preparations of the Pharmacopœia of the United States. His aim has been to make such additions only as are strictly necessary for the American student.

"The author of this book has succeeded admirably in placing in concise form what is necessary to be known of Materia Medica and Therapeutics, leaving it to larger works to enter into details."—*Medical and Surgical Reporter.*

"We have here a brief *résumé* of Materia Medica, all non-essential parts being omitted. It might be called a commentary on the Pharmacopœia, as it somewhat resembles Phillips' commentary on the London Pharmacopœia, though more extended in its descriptions of the action and uses of remedies."—*Eclectic Medical Journal.*

A YEAR-BOOK OF THERAPEUTICS, PHARMACY, AND ALLIED SCIENCES. 1872 & 1873.

BY H. C. WOOD, JR., M.D.

In handsome octavo volumes, bound in extra muslin. Price $2.50 *each.*

This "Year-Book" is made up from the pages of "New Remedies," and contains all the more important articles which have appeared in that journal during the past year, together with a few new ones. It will be published annually for the benefit of those who prefer to purchase the very valuable material it contains in this form rather than in unbound numbers as a periodical. A complete index has been added.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

BY SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"The author, as we have said, designed the book simply as an introduction to Therapeutics for the use of students and young practitioners. That to such it will be found most useful there is no doubt; but we are also sure that, from the mass of valuable, readable, and well-arranged information it contains, and the numberless minor practical hints scattered throughout its pages, the work will be almost equally useful to the busy practitioner; and that it will receive from the profession generally the warm welcome which it deserves."—*British Med. Jour.*

"We can scarcely doubt that the present edition will be quickly sold.'—*The Practitioner.*

"A very suggestive and useful work on therapeutics."—*St. Louis Med. and Surg. Journal.*

THE ELEMENTS OF THERAPEUTICS.

A CLINICAL GUIDE TO THE ACTION OF MEDICINES.

BY DR. C. BINZ, Professor of Pharmacology in the University of Bonn.

Translated from the Fifth German Edition, and edited, with additions, in conformity with the British and American Pharmacopœias.

BY EDWARD I. SPARKS, M.A., M.B., OXON.

Member of the Royal College of Physicians of London, Officier de Santé (Alpes Maritimes), France, formerly Radcliffe Travelling Fellow.

In one handsome 12mo volume, bound in extra muslin, price $2.00. *Sent by mail, free of postage, on receipt of price.*

"This work contains much valuable information, especially in regard to those remedies which exert an influence on the nervous system."—*St. Louis Med. & Surg. Journal, Feb.*, 1878.

"The desire to know how a medicine acts is just beginning to attract the attention it deserves. This work gives a clear description of the therapeutical action of medicines in a way that is sure to command attention and cause a more thorough investigation in this branch."—*Cincinnati Lancet and Observer, Feb.*, 1878.

"The work appears to have been written with great care, and bears the impress of reliability; and is a volume that we do not hesitate to recommend in the strongest manner."—*The Medical Record, Jan.* 12, 1878.

"The book is in every respect excellent. It is a judicious condensation of practical, useful facts, educed from physiological experiment and clinical observation."—*Am. Practitioner, Feb.*, 1878.

"The most striking features of the work are the conciseness with which the author expresses what is known on each subject, and a style which gives the subjects a freshness not commonly found in text-books on therapeutics, or in lectures on this topic."—*New Remedies, Jan.*, 1878.

"It is, on the whole, more trustworthy than the average text-book. In fact there is little in it that should be neglected by the medical student. We regret that such a work was not available during our own student days."—*Detroit Lancet, Feb.*, 1878.

STUDIES IN PATHOLOGY AND THERAPEUTICS.

BY SAMUEL HENRY DICKINSON, M.D., LL.D., Professor of Practice of Physic in Jefferson Medical College, Philadelphia, etc., etc.

In one handsome 12mo volume, neatly bound in extra muslin. Price $1.50.

"Mr. Dickson may be styled a medical philosopher, in the best sense of the term. He thinks independently, and has done a vast amount of good thinking in the 200 pages composing the 'Studies.' There are few writers who find the *middle way* so successfully. He shows no bigoted affection for the old, nor any shallow, pedantic passion for the new. We give his book a hearty recommendation to our medical brethern. They will rise from its perusal informed and refreshed."—*Pacific Medical and Surgical Journal.*

ESSAYS ON INFANT THERAPEUTICS.

To which are added Observations on Ergot; History of the Origin of the Use of Mercury in Inflammatory Complaints; with the Statistics of the Deaths from Poisoning in New York, in the Years 1861-2-3.

BY JOHN B. BECK, M.D.

Third Edition. One very neat duodecimo volume, muslin. Price $1.00.

"A perfect gem. We regard it as one of the most useful books in our library."—*New Jersey Medical Reporter.*

"An excellent little work, from the very highest authority."—*Western Lancet.*

Sent by mail, post-paid, on receipt of price.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE,

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES,** which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

This is to Certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS, and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.
Prof. of Chemistry and Toxicology in Bellevue Hospital Med. Col., and Prof. of Chemistry and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz.: **Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.**

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and perfect instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8¼ x 7¼ x 4¼. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

Sole Agents in America for Blair's Gout and Rheumatic Pills.

Importers of Superior Norway Cod Liver Oil—put up in Pint Bottles; also by Barrel or Gallon, at the lowest market rates

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1868 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

Rigollot's Paper

is not (as certain storekeepers of bad faith pretend) a production that any one can make.

Rigollot's Paper

is not manufactured with a mustard that every one can buy.

Rigollot's Paper

is one of the most marvelous discoveries of the contemporary pharmacopœia.

Rigollot's Paper

is the invention of M. P. Rigollot who is the exclusive owner, and is the only preparation of the kind which obtained a medal and diploma at the Philadelphia Exposition.

It is sold wholesale at

No. 24, Avenue Victoria, Paris.

All other mustard leaves which do not bear the signature of P. Rigollot are but imitations of his remarkable invention and should not be bought.

Rigollot's Paper

is the only one adopted by the Civil and Military Hospitals throughout the whole of Europe.

To be had of all the principal Chemists and drug stores in the world.

Insist that the signature is on each leaf.

P. Rigollot

SOLUBLE

MEDICATED GELATINE BOUGIES

Or, PORTE REMÈDE,

For the Treatment of Gonorrhœa and Chronic Gleet.

ADVANTAGES OF THE BOUGIE TREATMENT.

(1.) *A local remedy easily and safely applied.*
(2.) *Thorough action of the medicine upon the diseased part.*
(3.) *Gradual solution of the Bougie, causing prolonged action.*
(4.) *It will reach parts where other remedies will never penetrate.*
(5.) *It prevents strictures and reduces local congestion.*

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

E. F. HOUGHTON & CO.,
MANUFACTURERS,
215 South Front Street, Philadelphia.

This soap is confidently offered to the medical profession and the public, as being a detergent, which, from the nature of its composition, possesses UNDOUBTED HEALING QUALITIES.

It is a preparation of useful VEGETABLE OILS, CHEMICALLY PURE GLYCERINE AND REFINED PINE TAR, in which EVERY INGREDIENT IS THOROUGHLY SAPONIFIED by a process peculiar to ourselves. We thus produce a detergent absolutely free from the valid objections frequently discoverable in soaps compounded from animal fats, which HAVE BEEN KNOWN to be POSITIVELY INJURIOUS TO THE SKIN.

This soap has already been used in many public institutions: as Nurseries, Infant Asylums, Hospitals, Dispensaries; etc., and abundant evidence, from them and from private physicians, can be given those desiring it, which will bear out all that is claimed for the remedial excellence of PACKER'S TAR SOAP.

In the treatment of

DISEASES OF THE SKIN,

this soap is of especial service: first, because while other soaps, if used, may and probably will exercise some injurious effect, this is the *least irritating of all* soaps; and second, because by virtue of its TAR and GLYCERINE, of which it contains a very large percentage.

SURGEONS find it the best soap for cleansing wounds, ulcers, etc., and for antiseptic and deodorizing purposes.

We feel the utmost confidence that the expectations of the physician will be uniformly realized, if a little pains is taken to designate PACKER'S in cases where TAR SOAP is indicated.

SOLUBLE TABLETS, TABLET TRITURATES, PILL & TABLET SATURATES

MADE ACCORDING TO DR. ROBERT M. FULLER'S METHOD.

These tablets, from their ready solubility or diffusibility, are destined to come into general use in the profession. Their advantages can be appreciated at once when they are allowed to dissolve in the mouth or in a teaspoonful of water. They are readily soluble in the mouth or stomach, or diffusible in a teaspoonful of water, and thus administered.

We make the following abstract from an address read by Dr. ROBERT M. FULLER, before the New York Academy of Medicine, and published in "The Medical Record" March 9th, 1878, in which he makes known an accurate method he has devised for dispensing certain medicines in separate doses, in a compact and palatable form:

"The inability frequently experienced by physicians to obtain certain medicines, in separate doses, of a desired formula and mode of preparation, led me, some time ago, to undertake a series of pharmaceutical experiments with a view of contriving some simple, inexpensive and readily available method of preparing the medicines so desired."

"After a number of varied and careful experiments, I succeeded in devising four methods of preparation."

"The preparations in question I have named *soluble tablets, tablet triturates*, and *pill* and *tablet saturates*, the former being designed for any powders which are to be administered in certain required doses, and the latter for certain fluid extracts, or other standard concentrated solutions."

"*Physicians practising [in the country, to whose use they are adapted by reason of their economy, dose-accuracy, compactness, and palatable form for dispensing, will find them almost indispensable.*"

"The SOLUBLE TABLETS generally consist simply of certain medicines made into soluble paste with the aid of sugar of milk, and alcohol, or water. The tablets are intended to embrace any medicines that can be made into a paste which is not too tenacious, such as fluid extracts, or sugar of milk containing *any* per cent. of chemical, such as arsenious acid, sulphate of morphia, muriate of ammonia, etc."

"The TABLET TRITURATES consist of triturations of metallic, mineral, and vegetable medicines. These triturations, with sugar of milk, are mixed with alcohol of any per cent., or water, according to the adhesiveness required, and the paste thus formed is then readily made into tablets of any size."

"The TABLET SATURATES are merely porous troches, or tablets designed for saturation. The difference between the tablets and the pills, beyond the difference in shape, being that the former will absorb a much larger quantity of fluid extract, or other standard concentrated solution, than the latter."

"The PILL SATURATES possess two favorable qualities, namely: they are made easily, and at an extremely low cost. Either of the above are of various sizes, and sold by the ounce or pound, for medication."

☞ We have these tablets either medicated or plain, for medication, and can supply physicians with them. Medicated according to any formula desired, and will make special rates when 100 or upwards are ordered.

CASWELL, HAZARD & CO.,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

McKESSON & ROBBINS'
GELATINE-COATED PILLS.

COCA EXTRACT, 1 gr.

Made from freshly imported leaves. As the leaves become almost inert with age, a preparation of this nature is necessary to enable the Physician to judge correctly of the value of this remedy. Coca Erythroxylon is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use, is said not to be followed by any depressing effects.

ERGOTIN, 3 grs.

Each pill is equal to half a teaspoonful of officinal fluid extract. The value of Ergotin, in the place of the crude drug and the Fluid Preparations, is conceded; and it is being largely administered both in this country and in Europe.

GRINDELIA ROBUSTA EXTRACT, 3 grs.

The Solid Extract is ten times the strength of the Herb; it can be used much more readily and with better effect than any of the liquid preparations. The use of this remedy in Hay Fever, and all Asthmatic difficulties, has increased largely in the Eastern States and Europe, and its therapeutic value is conceded. (Dose, 1 to 3.)

GUARANA EXTRACT (PAULLINIA), 3 grs.

The Solid Extract is eight times the average strength of the drug. The value of Guarana, in many phases of sick, nervous and sun Headache, as well as in Neuralgia, and in irritations of the mucous membrane, has become well-known to practitioners, and its happy effects in Diarrhœa, Dysentery and kindred diseases, have been attested in numerous cases. (Dose, 2 to 3.)

JABORANDI EXTRACT, 3 grs.

These pills present a much better and more acceptable form of administering this powerful Diaphoretic and Sialagogue, than any of the liquid preparations. Valuable in Rheumatism and all Syphilitic troubles of long standing. (Dose, 1 to 3.)

CALCIUM SULPHIDE, 1-10 gr.

Strongly recommended "in cases of Scrofulus and other unhealthy sores, glandular enlargement, boils occurring in crops, &c." In many skin diseases it is strongly indicated, being not only anti-parasitic and anti-herpetic, but also stimulant and tonic.

SALICYLIC ACID WITH MORPHINE.

{ Acid. Salicylicum, 2 1-2 grs. }
{ Morphiæ Sulphas, 1-12 gr. }

SALICYLIC ACID WITH MORPHINE.

[Acid. Salicylicum, 5 grs. Morphiæ Sulphas, 1-8 gr.]
Strongly recommended in Rheumatism, both acute and chronic.

SANDAL WOOD EXTRACT, 1 and 2 grs.

These pills contain both the oil and resin existing in Sandal Wood, are believed to be superior to the oil alone, and are more convenient of administration.

IRON, DIALYZED, 2 grs.

Made from Merck's scales or plates of Dialyzed Iron, and about twenty times the strength of the solutions in market.

I have in stock every Gelatine-Coated Pill made by McK. & R.

T. H. SAYRE, Dispensing Chemist,

Sixth Avenue, cor. 46th Street. New York.

NOTICE.—See our Advertisement, page 8.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent. of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or gramineous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchona Alkaloids. Quinidia, Cinchonidia, Cinchona, Quiniodin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academie de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878–1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DORÆMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

UNIVERSITY OF THE CITY OF NEW YORK.

MEDICAL DEPARTMENT.

410 East Twenty-sixth St., opposite Bellevue Hospital, New York City.

THIRTY-SIXTH SESSION.—1877-78.

FACULTY OF MEDICINE.

REV. HOWARD CROSBY, D.D.,
Chancellor of the University.

ALFRED C. POST, M.D., LL.D.,
Professor Emeritus of Clinical Surgery; President of the Faculty.

CHARLES INSLEE PARDEE, M.D.,
Prof. of Diseases of the Ear; Dean of the Faculty.

JOHN C. DRAPER, M.D., LL.D.,
Professor of Chemistry

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine.

WILLIAM DARLING, A.M., M.D., F.R.C.S.,
Professor of Anatomy.

WILLIAM H. THOMSON, M.D.,
Professor of Materia Medica and Therapeutics.

J. W. S. ARNOLD, M.D.,
Professor of Physiology and Histology.

JOHN T. DARBY, M.D.,
Professor of Surgery.

J. WILLISTON WRIGHT, M.D.,
Professor of Obstetrics and Diseases of Women and Children.

FANEUIL D. WEISSE, M.D.,
Professor of Practical and Surgical Anatomy.

JOSEPH W. WINTER, M.D.,
Demonstrator of Anatomy.

POST-GRADUATE FACULTY.

D. B. ST. JOHN ROOSA, M.D.,
Professor of Ophthalmology.

WM. A. HAMMOND, M.D.,
Professor of Diseases of the Mind and Nervous System.

STEPHEN SMITH, M.D.,
Professor of Orthopædic Surgery.

J. W. S. GOULEY, M.D.,
Professor of Diseases of the Genito-Urinary System.

MONTROSE A. PALLEN, M.D.,
Professor of Gynæcology.

HENRY G. PIFFARD, M.D.,
Professor of Dermatology.

A. B. MACDONALD, M.D.,
Professor of Medical Jurisprudence.

JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge*.

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

CHAMPION SPOUTING SPRING NATURAL WATER FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and as a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

F. G. OTTO & SONS'

STEAM ATOMIZER.

A is a cylinder (made of Russian iron) for the reception of a copper-bottom boiler, C, and an Alcohol lamp, B. D is the safety-valve, E the Glass spray tube, F the medicine cup, H the face shield, I is a split tube which slides on the upright K, by means of which the face shield may be lowered or raised at will. G is a glass cup, and serves as receiver for the drippings of the face shield.

DIRECTIONS FOR USE.

Unscrew the valve D, fill the boiler to about three-quarters of its capacity with water, and screw the valve D on securely; then light the Alcohol lamp B. When sufficient steam is generated, it will pass through the horizontal part of spray tube and blow over the perpendicular part, which will then suck up the medicine from the cup F, and will produce a very fine spray.

In placing this Steam Atomizer before the profession and public, we have tried and succeeded to make a perfect and at the same time a cheap and reliable instrument.

Price, $4.00.

F. G. OTTO & SONS,

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material, the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's and all other shapes. *Manufactured only by*

LESSONS IN
Physical Diagnosis.

THIRD EDITION. REVISED AND ENLARGED.

In one handsome octavo volume, cloth, $3.00.

NOTICES OF THE PRESS.

"The previous editions of this volume have been very well received, and, from their ready sale, appear to meet a well-recognized want. . . . We find the plan of the work excellent, and, within the limits proposed by the author, very well carried out. It would be easy to point out many omissions; completeness and conciseness to a certain degree exclude each other; but in the space assumed, it would be difficult to include a greater variety and amount of sound teaching. The style is compact, clear, positive, and exact. It is free from all irrelevant discussions; nothing is allowed to disturb or confuse the distinct image of clinical facts. . . . The book is very creditable to its acute and industrious author; and whoever shall practically master its contents cannot fail to be a discriminating and well-furnished diagnostician."—*The Medical Record.*

"For students it is the best work on physical diagnosis that is published."—*Detroit Review of Medicine.*

"This is a work already well and favorably known to the profession. In the present edition the original text has been entirely revised and enlarged by the addition of five new lessons."—*Chicago Medical Examiner.*

"Students of medicine and practitioners will find this just the work to meet their wants on the subjects of which it treats. Its instructions are full and very plain."—*Cincinnati Medical News.*

"The previous editions of the work, confined to an exposition of the subject of physical exploration of the chest and abdomen, we have regarded as among the very best works on the subject extant, and hence recommended 'Loomis on Physical Diagnosis' to our classes; and it gives us pleasure to repeat, in this form, our hearty commendation of the book."—*Mich. University Medical Journal.*

LECTURES ON
Diseases of the Respiratory Organs,
HEART AND KIDNEYS.

In one handsome octavo volume of over 550 *pages. Price, in extra muslin,* $5.00; *or, in leather,* $6.00.

NOTICES OF THE PRESS.

"It is clear in style, convential in arrangement, very definite and practical in its teachings."—*Philadelphia Medical Times.*

"We like the systematic method in which these lectures are arranged, and regard them as excellent in every way."—*Cincinnati Lancet and Observer.*

"By all means buy Loomis' work and *study* it."—*Ohio Medical and Surgical Reporter.*

"In the one before us the reader may look confidently for the last words on the subject, and may rest assured that what the author has here committed to the press is the result of much learning, sound judgment, and thorough experience."—*American Practitioner.*

"We have no hesitation in pronouncing it one of much value to the profession, and highly creditable to the author."—*New York Medical Journal.*

"While the views presented are fully up to what is actually known on the subjects treated, the doctrines are judicious and safe. At the same time they are presented with unusual clearness, and with sufficient positiveness to command confidence."—*New Orleans Medical and Surgical Journal.*

LECTURES ON
FEVERS.

In one handsome octavo volume. Cloth, $4.00; *Sheep,* $4.75.

NOTICES OF THE PRESS.

"We have before us, therefore, a book containing statements of practical facts relating to certain diseases, and the theories regarding their nature, mode of origin and propagation, and arranged so as to be easily comprehended by the medical student. We also believe they will be read without weariness by the daily practitioner. . . . It contains much practical knowledge, and cannot fail to be read by a very large proportion of the medical profession; for a concise statement of facts—with only such qualifications as can be safely indulged in without endangering perspicuity—is always acceptable."—*The Medical Record, Nov.* 24, 1877.

"This last work of Professor Loomis' is a valuable contribution to medical literature. His treatment of the subject is mainly practical, and is in strict conformity with what the author has himself observed at the bedside. The general management of fever is justly regarded of greater importance than the administration of drugs. It is a book that will well repay careful study."—*Western Lancet, January,* 1878.

"The work is clearly and concisely written, and will be useful and acceptable to both student and practitioner."—*N. Y. Medical Journal, March,* 1878.

"In this interesting volume, which contains the lectures on fevers delivered by Professor Loomis to his class during the last year, we have a concise and impartial review of the literature concerning fevers, which has been published since 1850 with reference to a few older books, 'because they contain many of the so-called new theories and modes of treating fevers.' In this are embodied the results of the author's own extensive clinical experience, which has led him to form opinions in certain respects at variance with those of some other observers; and the weak points of theories and modes of practice which have not stood the test of time, are clearly set forth."—*Boston Medical and Surgical Journal, Dec.* 22, 1877.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

In corresponding with Advertisers please mention **The Medical Record.**

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges***, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

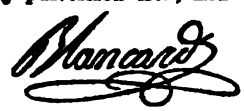
The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

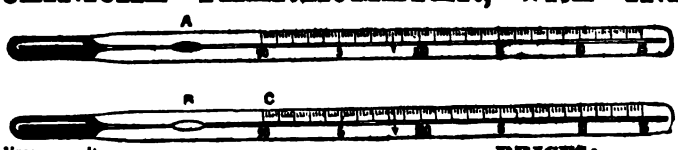


Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



† This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

E. FOUGERA & CO., Agents, 30 North William St.- New York.

A MANUAL OF

HISTOLOGY

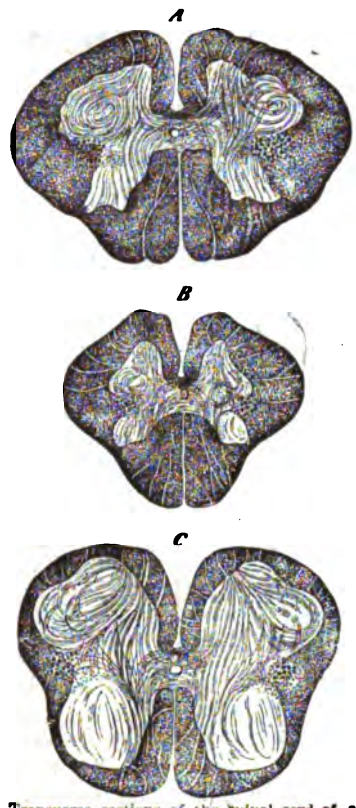
By Prof. S. STRICKER, of Vienna, Austria,

IN CO-OPERATION WITH

TH. MEYNERT, F. VON RECKLINGHAUSEN, MAX SCHULTZE, W. WALDEYER, and others. Translated by HENRY POWER, of London; JAMES J. PUTNAM and J. ORNE GREEN, of Boston; HENRY C. ENO, THOMAS E. SATTERTHWAITE, EDWARD C. SEGUIN, LUCIUS D. BULKLEY, EDWARD L. KEYES, and FRANCIS E. DELAFIELD, of New York. American Translation Edited by ALBERT H. BUCK, Assistant Aural Surgeon to the New York Eye and Ear Infirmary.

A most superb Octavo volume of over 1100 pages, with four hundred and thirty-one illustrations on wood, engraved in the finest style. Richly bound in extra muslin and in the best leather. Price in muslin, $10.00; leather, $11.00.

Sent by mail, postpaid, on receipt of price.



Transverse sections of the spinal cord of a child six months old at various levels. Magnified 8 diam. A. From the middle of the cervical enlargement. B. From the middle of the dorsal region. C. From the middle of the lumbar enlargement.

NOTICES OF THE PRESS.

"At once the most extended and valuable treatise on Histology which has yet appeared."—*Am. Journal of Medical Sciences.*

"The translation of Mr. Power covers 406 pages of the present edition; but the remaining articles are translated by the American gentlemen above named. Nearly two-thirds, therefore, of the book are translated by Americans, who are physicians especially interested in the departments which they have undertaken. In this there is evident advantage, as one who is already familiar with a subject is the more likely to grasp obscure points, which are perhaps rendered still more obscure by being couched in a foreign idiom. There is also likely to be more freshness about an article thus translated than if it form, in the original, one of a large number, and by different authors, translated by a single individual; for the weariness which must necessarily grow upon the translator of so large a volume, is not relieved by the increasing familiarity which he must acquire if the papers are all by the same author.

"This series of papers, edited and in many instances written by Prof. Stricker, constitutes at once the most extended and most accurate treatise on Histology extant. And as the study of Histology is a subject which admits only the latest and most accurate information to its aid, this work must necessarily supersede all others. It becomes, therefore, absolutely indispensable to every histologist and physiologist in the world, as well as to all physicians and surgeons who would pursue their departments with all the light of modern science."—*Phila Medical Times.*

"The need of a work of this kind has been felt for some time past. The last edition of Kölliker contains points which he himself has altered in his later editions, which have not been translated. The publication of this work is destined to give increased zest to the study of minute anatomy, a study which is becoming a necessity to any one who desires to be a thoroughly educated physician.

"We believe this book to be indispensable to any physician who desires to understand the present position of medical science, and to know, if not to find out for himself, the present knowledge of the minute anatomy of the human body. The authors, as remarked before, are men who have devoted themselves to these studies, and do not limit themselves to communication of the facts, but in many places treat of the methods of obtaining good specimens for self-study.

"As for the book itself, it has been published in good style. The type is clear, the wood-cuts are equal to those of the German edition, and there are but few typographical errors."—*The Medical Record.*

"Every medical student and every scientific practitioner should study this work, as, better than any other in the English language, it exhibits what has been demonstrated respecting the minute structure of the body."—*Detroit Review of Medicine.*

At MT. SINAI HOSPITAL, OUT DOOR DEPARTMENT,

By PAUL F. MUNDE, M.D.,

For graduates only. Course 12 lessons of two hours each. Fee $30.00. For further information, apply to

DR. MUNDÉ, 20 West 45th St., New York.

Medical Pictures and Portraits

For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood

A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.50
Size, 15x18 " " " 22x28. " 4.00

The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.

(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.

From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching, Proof Copies. Price, $1.25

JENNER VACCINATING A CHILD

Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.

To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 15x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x13 " on granite " 11x19. " 2.00

HIPPOCRATES.

A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF

(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT. } Price, 50 cents each.

THE LUNATIC ASYLUM.

This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÈ VESALE.

A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.

A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., 27 Great Jones Street, New York.

TO ADVERTISERS.—Permit us to direct your attention to "THE MEDICAL RECORD." It has now been published over twelve years, and has become the most popular and most extensively read of any medical journal in America. Its circulation is widespread over the entire continent—probably there are few of the active, intelligent members of the Profession who are not among its regular readers. The value to Advertisers of this large list of subscribers has long been recognized, as practically shown by the great number of pages of advertisements, rendered necessary by the patronage of those who have found that

IT PAYS TO ADVERTISE IN THE MEDICAL RECORD.

THE MEDICAL RECORD HAS THE LARGEST CIRCULATION OF ANY JOURNAL OF ITS KIND IN AMERICA.

Issues over 800,000 a Year.

ITS CIRCULATION IS WELL DISTRIBUTED OVER THE NORTH, SOUTH, EAST AND WEST.

Recent Testimony of Experienced Medical Advertisers who have Tried it.

GENTLEMEN:—Having advertised for a term of about two years in THE MEDICAL RECORD, I cheerfully express to you my appreciation of its value. Its high professional standing entitles it to the first place as an advertising medium, and the results I have obtained for all my goods through it, verify this. I likewise consider its rates, in proportion of the number of copies which it distributes to the best class of the medical profession, as cheaper by far than most all the so-called, low-priced papers. Very truly yours, F. ALFRED REICHARDT, Pharmacist.
NEW YORK, *January* 30, 1878.

GENTLEMEN:—The results obtained by our advertising in THE MEDICAL RECORD have been very satisfactory, and we cheerfully recommend it as being one of the best mediums for reaching physicians. Yours truly, W. H. SCHIEFFELIN & Co.
NEW YORK, *January* 31, 1878.

GENTLEMEN:—We have renewed our contracts with you this year, as we are well satisfied with our advertisements in your MEDICAL RECORD, which have extended over a number of years. We believe the RECORD to be very ably edited, and its large subscription list of physicians is well merited. Yours respectfully, MCKESSON & ROBBINS.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—Having advertised in THE MEDICAL RECORD almost continuously from the time it was first published, we consider it the best medium for reaching the medical profession of this country. Yours respectfully, CASWELL, HAZARD & Co.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—It gives us great pleasure to speak of the merits of THE MEDICAL RECORD. The able manner in which it is edited and managed give it a wide influence amongst the medical profession of this country. Sincerely yours, WM. R. WARNER & Co.
PHILADELPHIA, *February* 5, 1878.

GENTLEMEN:—Continued advertisement in THE MEDICAL RECORD, lead us to say that we regard it as the *best* journal for reaching the medical profession that we know of, owing to its wide circulation and the thorough manner in which it is circulated. Yours truly,
PHILADELPHIA, *February* 5, 1878. KEASBEY & MATTISON.

GENTLEMEN:—During the time we have had our advertisement in THE MEDICAL RECORD we have found it to be the very best advertising medium, and we beg to say that we cannot recommend it too highly. We have had more orders in consequence of our advertisement in THE MEDICAL RECORD than from all other journals we advertise in combined.
NEW YORK, *January* 30, 1878. F. G. OTTO & SONS, New York.

GENTLEMEN:—Having advertised in THE MEDICAL RECORD for a number of years, we can confidently recommend it to advertisers as one of the best mediums known to us.
NEW YORK, *January* 30, 1878. Yours respectfully, GEO. TIEMANN & Co.

GENTLEMEN:—As constant advertisers in THE MEDICAL RECORD, we are happy to state that we consider the RECORD one of the very best mediums for reaching the medical profession.
NEW YORK, *January* 28, 1878. We are yours truly, E. FOUGERA & Co.

GENTLEMEN:—Your MEDICAL RECORD has been very satisfactory as an advertising medium; nearly every mail bringing orders and inquiries from its readers. From letters received, the "RECORD" must reach all quarters of the globe. Yours truly, A. J. DITMAN, Druggist.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—We are entirely satisfied with the results of advertising in THE MEDICAL RECORD. There is no better medium for reaching the medical profession in the United States.
Very respectfully, TROMMER EXTRACT OF MALT Co.
FREMONT, OHIO, *February* 10, 1878.

Advertising Terms furnished on application.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

FOOD for INFANTS and INVALIDS.

BLAIR'S
PREPARED WHEAT FOOD,
A Nutritious Diet for Infants.
Contains more of the nitrate and phosphates (muscles and bone forming element) than most farinaceous foods. Price low and sells well: guaranteed to keep.
HENRY C. BLAIR'S SONS,
Eighth and Walnut Streets,
PHILADELPHIA.

HORLICK'S FOOD FOR INFANTS.

This article, as shown by analysis, is the only true substitute for Mother's Milk, and, unlike the other foods, **does not contain starch.** Infants cannot digest **starchy foods** until they have their teeth. This preparation also contains the **Phosphates** so essential for the production of bone and brain. It will **sustain life single-handed.** Requires no cooking.

We also Manufacture
HORLICK'S FOOD FOR DYSPEPTICS.
HORLICK'S FOOD FOR CONSUMPTIVES.

Price $1.00 per bottle. Trial size, 50 cents.

J. & W. HORLICK & CO., Chicago, Ills.

PREPARED FOOD
FOR
INFANTS AND INVALIDS.

Prepared especially to meet the requirements of the growing Infant, containing the Phosphates and all the health-giving properties of the finest wheat, many of which are altogether rejected in the usual process of preparing flour.

Also admirably adapted on account of its easy digestibility to Invalids. Price 35 cents per package.

BENJAMIN J. CREW, Pharmacist.
PHILADELPHIA.

The K. & M.
INFANTS' FOOD

Perfectly free from Starch and perfectly soluble.
CONTAINS NO ALCOHOL.
An extract prepared from malted grain, consisting of grape sugar, dextrine, alkaline phosphates, etc.

"A child deprived of its mother's milk, can only be fed properly when the food is equivalent in power to woman's milk."—BARON LIEBIG.

DIRECTIONS FOR USE.—Dissolve a tablespoonful of this extract in one-third of a pint of fresh, warm cow's milk, by simply stirring it. This being double the strength of mother's milk, it should be diluted with an equal quantity of warm water, until the infant is some months old.

Prepared with the most scrupulous care by

KEASBEY & MATTISON, Manufacturing Chemists.
332 N. Front St., Philadelphia, Pa.

Papoma for Infants & Invalids.

IS ESPECIALLY DESIGNED FOR INFANTS AND INVALIDS.

It possesses all the required elements necessary to nurture, strengthen and promote a vigorous and healthy growth in children, and to restore and sustain the exhausted vitality of the sick and debilitated. It is delicious and palatable when no other diet is relished or desired. Eminent physicians highly approve and regard as much superior to all other preparations of food. It may truthfully be claimed as a substitute for Nature's own food to infants—a fact which all mothers and those having children should remember.

JOHN WYETH & BRO., Philadelphia.

Dr. N. Gerber's Milk-Food

Prepared in THUN, SWITZERLAND.

Many farinaceous foods prepared for children contain too much sugar and starch, while the milk added to these foods is insufficient in quantity, so that the proportion between the azote and non-azote bodies is not fairly balanced, and consequently, the children are fed in an irrational manner.

After long experimentation, in which I have sought to avoid this serious defect, I now offer an article which I believe will meet the necessity of the case, inasmuch as it contains **less starch and sugar and more milk.**

DIRECTIONS.

For children up to three months old, one part of the "Food" to eight or ten parts **cold water.** The quantity of water may be reduced for older children to four or five parts to one of "Food." After mixing well, boil it five minutes, taking care to stir it well.

CHEMICAL ANALYSES.

The composition of Dr. N. GERBER'S "Milk-Food" is stated by well-known Chemists, as follows:

THE ANALYTICAL SANITARY INSTITUTION,
LONDON, April 27, 1876.

The results of my analysis show that Dr. GERBER'S Milk-Food is composed in part of condensed milk; that it contains all the elements of a complete food, namely: the Starchy, Saccharine, Albuminous, and Mineral, in such proportions as render the food well adapted for the nutrition of infants and young children.

The amount of Nitrogenous matter and of Phosphoric Acid furnished are considerable.

The Nitrogenous matter includes 1.88 per cent of Nitrogen, and the Mineral matter 0.51 per cent of Phosphoric Acid.

ARTHUR HILL HASSALL, M.D., Chemist,
Author of "Food; its Adulterations, and the Method for their Detection."

MONTREAL, Canada, November 10, 1877.

I have satisfied myself that Dr. GERBER'S Milk-Food is not a mere "Farinaceous Food," but that it really contains, as it professes to contain, the formative elements of *Flesh, Blood and Bone*; also *Carbonaceous Matter* for the maintenance of animal heat,—thus consisting a *complete diet*, formed on the basis and type of Human Milk. * * * I can conceive of no better substitute for "Mother's Milk."

J. BAKER EDWARDS, Ph.D., D.C.L.,
Professor of Chemistry Bishop's College and College of Pharmacy, Montreal, and Public Analyst for District of Montreal, under Inland Revenue Act.

HYGIENIC PHYSIOLOGICAL INSTITUTE,
MUNICH, Sommer, 1877.

Repeated experiments of Dr. GERBER'S Milk-Food, made by D. Med. FR. RENK, Assistant of Privy Counsellor Prof. Dr. MAX VON PETTENKOFER, at his Laboratory; also, at Prof. Dr. C. VOIT'S Physiological institute in Munich, show the average analysis to be:

Water,	4.31 per cent.
Mineral Salts,	2 03 "
Fats,	5 23 "
Albuminates,	15.51 "
Hydro-Carbons, soluble,	48.41 "
" " insoluble,	24.46 "
	99.95 "

This preparation is highly recommended by:

Prof. DEMME, Physician to the Jenner Hospital for Children Berne, Switzerland.

Dr. J. RUD. SCHNEIDER, Sup't of the Hospital of the Canton Berne, Switzerland.

A. M. SIGEL, M.D., Phys. to the Olga Hospital Asy. for Infants, Stuttgart.

Dr. PIO MORI, Medico Primario, Phy. to Hospital for Children, Rome, Italy.

Dr. GRIFFINI, Director of the Foundlings' Home and Lying-in Hospital in Milan.

E. BOUCHUT, Professor of the Faculty of Medicine of Paris, and Phys. to the Sick Children's Hospital.

Prof. Dr. ZWEIFEL, in Erlangen.

Send for Circular with full particulars and valuable testimonials from prominent American physicians.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia	1-60 gr.	**Mercury, Proto-Iodide**	1-5, 1-4, 1-2 gr.
Arsenious Acid	1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**	1-8, 1-4 gr.
Atropia	1-60 gr.	**Morphia, Sulphate**	1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract	1-4 gr.	**Morphia, Valerianate**	1-8 gr.
Calcium, Sulphide	1-10 gr.	**Podophyllin**	1-8, 1-4 gr.
Codeia	1-16, 1-5 gr.	**Quinia**	1-2, 1-4 gr.
Corrosive Sublimate	1-40, 1-30, 1-20 gr.	**Strychnia**	1-60, 1-40, 1-30 gr.
Digitalia	1-60 gr.	**Sulphur, Iodide**	1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.		**Tartar Emetic**	1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide	1-25, 1-16 gr.	**Zinc, Phosphide**	1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or, using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

SOLUBLE PILLS.

170 WILLIAM STREET, NEW YORK, October, 1876.

THE marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia and other recognized formulas, has induced us to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

The best substances are used in their manufacture. No article required by a formula is omitted on account of its high cost, nor are any pills deficient in weight; so that we can guarantee them to be made in strict accordance with the standard formulas, *both as regards the materials called for and in weight.*

The pills are coated while soft, and the excipients employed are such as preserve a mass readily soluble in the juices of the stomach, thus insuring prompt action.

The coating, which is soluble and so transparent as to clearly reveal the color of the mass, effectually covers any nauseous taste, and renders the pill easy to be swallowed. Its solubility can be readily tested by allowing a pill to rest upon the tongue for a few seconds.

Particular attention is called to our Granules of Morphine, Strychnine, Arsenious Acid, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in this shape, accurately weighed and ready for administering, has long been recognized. We have taken every precaution to insure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon.

We shall be happy to furnish any samples that may be desired.

NOTICE—See our Advertisement in alternate numbers of the RECORD.

Original Lectures.

LECTURES ON FEVERS.

By ALONZO CLARK, M.D.,

PROFESSOR OF PATHOLOGY AND PRACTICAL MEDICINE IN THE COLLEGE OF PHYSICIANS AND SURGEONS IN THE CITY OF NEW YORK.

(Reported for THE MEDICAL RECORD.)

LECTURE III.

TYPHOID FEVER (CONTINUED)—TREATMENT—BASTARD TYPHOID FEVER—EPHEMERAL FEVER—CESSPOOL FEVER—TYPHO-MALARIAL FEVER.

GENTLEMEN:—In the treatment of typhoid fever you cannot be too careful to have an abundance of *fresh air* admitted into the sick-room, both for the benefit of the patient and for the safety of those who are attending him. I never fail, except under circumstances which render it impossible, to have a window on the side of the room opposite the patient dropped a certain distance from the top, even in the winter season, and then make the patient comfortable by bed-clothing, and protect him from a draught of air by the use of a screen. You may remember what I said with reference to fresh air in the treatment of typhus fever, and I value it quite as highly in the treatment of typhoid.

There are a few other considerations which must be mentioned. First, of *bed-sores*. These are likely to come upon certain parts of the body which specially press upon the bed, and there is no remedy so effectual for their prevention and treatment as the water-bed. The water-bed equalizes the pressure of the body, and allows the sores to heal, whether they occur in consequence of fever or in consequence of paralysis. If the water-bed cannot be obtained, about the best substitute is the padded ring or a rubber ring filled with air. There is no wash, no plaster; there is nothing, except to relieve the part from pressure, which will prevent the occurrence of these sores when once they commence, or allow them to heal when they have been formed. When one threatens to form upon the heel, remove all pressure from that part by placing a proper support under the calf of the leg. When they threaten to form over the scapula, some kind of support must be placed under the back and along the spinal column, so that the weight will be removed from the part threatened. These bed-sores increase the danger and complicate the disease in proportion to their extent.

For the *tympanites*, Hasse, of Sweden, in giving a summary of 3,000 cases, attaches a great deal of importance to the application to the abdomen of cold compresses, and covering them with oil-silk. He thinks that this application exerts a derivative influence such as prevents, to a certain extent, the formation of ulcers in the intestines. The Peyer's patches situated nearest the ileo-cæcal valve are affected earliest and most constantly. From that point the disease advances upwards, and Hasse thinks that by the use of cold wet compresses the development of ulcers in the upper part of the small intestine is prevented, and the tympanitic distention of the bowels is diminished.

In some cases the distention of the bowels becomes so considerable as to be the cause of a great deal of distress: the diaphragm is crowded upward, and breathing is very much embarrassed.

Under such circumstances, several expedients have been resorted to for the relief of the patient. Commonly some moderately stimulating injection will be found to be of service. An injection of half a pint of fluid composed of Labarraque's solution 1 part, and water 16 parts, will sometimes prove very effectual in removing the gas from the intestines. Dr. Wood, of Philadelphia, thinks the removal of the tympanitis can be best effected by the use of spirits of turpentine in doses of from 8 or 10 drops, given in mucilage. It is thought that it acts by stimulating the muscular coat of the intestine to contraction.

With regard to *abscess*, which occurs in the advanced stages of the disease. It frequently happens that pus is produced very rapidly, and it may do a great deal of harm by dissecting up muscles and separating parts which should remain united. The only way of relieving the patient from mischief by this dissection is to open the abscess early. Do not mind what the surgeons say about not opening cold abscesses until pointing is well marked, for they have not seen as much typhoid fever as have the physicians, and the physicians open them as early as possible, however small the abscess may be. Following the advice of the surgeon, I have seen, more than once, empyema produced by perforation of the sternum and emptying of the contents of the abscess into the mediastinal space, and into the pleural cavity.

That is not a pleasant complication, especially when it could have been prevented by opening the abscess early.

When there is *peri-parotiditis* cold may be applied in its early stage, either in the form of cold compresses or ice. If the inflammation advances to suppuration, open the abscess early, and so prevent the extension of the disease.

If the doctrine be true that evacuations from the bowels of persons sick with typhoid fever are a source of contagion, a precept follows to which all will agree, and that is to *disinfect the discharges* at once. By this I mean mix with them something which will prevent any putrefaction or fermentation, and the best manner is to place in the bed-pan or vessel a half pint or pint of a solution of the sulphate of iron just before it is to receive the evacuation. This is, perhaps as good a hindrance to fermentation as any among the many substances called disinfectants. Besides this, there should be particular care that none of these disinfected dejections are put into the privy vault; they should be deposited in a hole dug in the ground and from time to time covered with fresh earth. The spot where the dejections are deposited should be so situated as to exclude the possibility of contaminating water used in the family.

The *bed-clothes*, as soon as they are soiled, should be removed from the bed and plunged into a tub of water which is sufficiently impregnated with carbolic acid to secure effectual disinfection. When this is done, I believe they may be safely sent to the washer-woman. If the doctrine of fermentation is true, the disease should not be permitted to spread at all. I am not sure that it is true. We have not had opportunity to give it a full study. But it comes to us with so much authority that the rules derived from it deserve consideration.

With regard to the *administration of medicines*. There are many physicians, especially in England, who attach considerable importance to the use of mineral acids, and, as far as we can judge, it does not matter much which one is used. One physician prefers the phosphoric acid; another prefers the muriatic; and still another the sulphuric; but all agree that there is

an amelioration of symptoms when these medicines are used. Some of the German physicians are much attached to preparations of iodine in the treatment of typhoid fever. For instauce, 6 grains of iodine and 12 grains of iodide of potassium are dissolved in 1 ounce of water; of this they give 2, 3, or 4 drops every two hours.

Another German writer attaches much importance to the administration of 5 grains of calomel once, twice, or three times a day in the early part of the disease. We have been very familiar with the use of calomel in this country in the treatment of typhoid fever, and it has been pretty generally abandoned.

Next, with reference to *the use of stimulants.* It is one of the most difficult things in the world to keep the medical profession plumb. At one time they will bleed for certain diseases, and bleed *coup sur coup,* and at the end of no more than ten years, perhaps scarcely a medical man can be found who bleeds in the treatment of any disease whatever. The pendulum goes up upon one side, and when it comes down it does not stop at the perpendicular, but swings high up upon the opposite side. So it is with whatever medical doctrines are brought forward; they are carried to extremes, are found to do harm, are then rejected, when probably there is some good in them all. This is especially true with reference to the use of stimulants in the treatment of disease. Thirty years ago they were regarded as harmful except in certain conditions. Afterwards came a day when they were used for the relief of almost every disorder, and now I found it very difficult to keep my young men in the hospital from the excessive use of them.

As a matter of fact, two-thirds of the patients sick with typhoid fever do better without than with alcoholic stimulants. Occasionally a case occurs in which the feebleness and frequency of the pulse, and the general condition of prostration, will suggest the inquiry, whether alcohol should not be given. When alcoholics diminish the frequency and increase the force of the pulse, they do good, and then they should be given in such quantity as is necessary to give this force and diminish the restlessness and suffering of the patient. But in considering that point you are to bear in mind another: the stage of the disease. I cannot, perhaps, better illustrate what I mean to say than by referring to two cases which I saw on the same day.

I went out of town a few miles to see a case of typhoid fever, and found that the patient had the symptoms of the third, in the first week of the disease. There were the dry tongue, sordes upon the teeth and lips, delirium, restlessness, imperfect consciousness, involuntary evacuations from the bladder and bowels.

I said that man must die. To give him alcohol would be of no benefit whatever. He died in the beginning of the second week, and I do not believe that all the alcohol which has been distilled since the sun began to shine could have saved his life.

In the evening of the same day I visited a young lady who was in the fourth week of typhoid fever. Her condition was almost exactly that of the man whom I had visited in the early part of the day. There was the dry tongue, the delirium, the rapid, small pulse, etc.—in short, she had symptoms belonging to the fourth week of the disease—and the question was, Shall we give brandy? Answer, yes. For if we can keep her alive to the end of this week her life probably can be saved; and the result was, she recovered. The very severe symptoms appearing early will not yield to any remedy which can be given. The heart will fail before the natural period at which the disease terminates can be reached.

As a rule, when a person has had this disease he will not have a second attack. In the town of Richmond, Mass., Dr. Jennings saw two epidemics of typhoid fever, occurring with an interval of two years. About sixty persons were attacked in each epidemic. In the second *two* of those who two years before had had the fever had a second attack, and that is what is likely to occur in any epidemic recurring within a short period. Those who have had the disease may regard themselves as having an immunity not entirely complete from its recurrence. Exactly the same experience occurred to Dr Jennings with reference to scarlet fever. So typhoid fever may be pretty safely compared with the eruptive fevers with regard to liability to a second attack. Persons advanced in life are not liable to an attack, or only in a slight degree. Infants, quite young, do not have the disease, but after one year of age they can.

BASTARD TYPHOID FEVER.

There is a form of disease, which has a certain resemblance to typhoid fever, and yet has not probably its characteristic lesions. A man, for instance, finds himself quite uncomfortable; after a little time he feels chilly; perhaps these chilly feelings last for a day or two; he has alternating with the chills periods of heat, and, altogether, he does not feel well. He rises the next morning, feels about the same, has but little energy, perhaps lies upon the sofa. He takes some light article of food, but his appetite is nearly gone. He goes to bed at night, thinking that a night's rest will make him feel better. He gets up on the following morning, and, as soon as he begins to move about, he finds that he is weak; it is much more agreeable for him to sit than to stand, and he had rather lie down than do either. His pulse is moderately increased in frequency. His temperature is 102° F., perhaps 103° F. In this condition he goes on day after day, until he becomes accustomed to this continuation of symptoms, and then he keeps his bed most of the time. It is not a dangerous illness, and yet it lasts about the same length of time as does typhoid fever. There is no diarrhœa, no tympanitic distention of the abdomen, no eruption of any kind, no delirium—or if delirium is present, it occurs at night, and is only of short duration. There is loss of appetite, and a rather mild fever, which lasts about four weeks. I have described the disease in this way for many years, and I have observed that persons in other countries have observed the same kind of fever. I do not know what it is; we are ignorant concerning its lesions, for, in my observation, there have been no deaths. For want of a better name, I have called it *bastard typhoid fever.* The *treatment* is entirely by symptoms, from beginning to end.

We have no reason to suppose that it is communicable, as I have not seen two cases in any family, and, in that respect, it would be distinguished from typhoid fever.

EPHEMERAL FEVER.

There is a fever which I have already mentioned, and to which I must again make brief reference. It is the ephemeral fever. It is best known during an epidemic of typhus or typhoid fever. It begins just as these two fevers do. It runs in the most marked cases only about one week, and then subsides of its own accord. While it continues you cannot be sure that it is not typhus or typhoid fever, whichever disease may

be prevailing. I have often thought that it would be worth while to inquire whether it does not occur, for the most part, in persons who have had typhus or typhoid fever, and in whom the susceptibility to those diseases is limited.

At all events, it is an affection which does not run a definite course; it is not a distinct fever. It usually subsides after two or three days, and then the patient is soon well again.

CESS-POOL FEVER.

Every summer I see a certain number of cases of a febrile disease, which is attended by exhausting diarrhœa and great prostation, and in almost every instance the sickness can be traced either to foul water, water made foul by the admixture of human excrement, or to neglected privies.

Most of you will remember something of such a disease, which took for the most part a chronic form, occurring in one of the hotels in Washington several years ago. It was a chronic diarrhœa; there were some acute cases; but most of them were chronic, continuing at least for several months, and in some cases for one or two years. Some of those patients recovered, but a great many were worn out by the disease. We see the same thing here sometimes arising from contamination from sewers.

The number of deaths occurring yearly in New York from this cause I do not know exactly, but probably it is fifteen or twenty. From what I know of the disease, it always has the same history. It is not usually ushered in by a chill; sometimes it is, but there is always a certain amount of fever; there is a diarrhœa, and its duration is usually two or three weeks. You may perhaps obtain a better idea of the leading features of the disease from a letter which I received some three years ago from a physician whose son died of it while at school. He writes: "I was summoned to visit my son on Monday, September 28, 1874. I found him in bed, pale and emaciated; pulse 100, soft and moderately full. His tongue was covered with a white coat; his mind was clear when awake, and I learned that he had been unwell a little more than two weeks with diarrhœa, consisting of from four to eight large discharges daily. Early in his sickness he had a chill, but had a diarrhœa before the occurrence of the chill. He had not had any headache at all, no epistaxis, no tenderness or pain in the abdomen or iliac region. He had had no appetite for solid food for a week previous to the commencement of his sickness, but had taken milk with relish. There were no sordes about the mouth, no tympanitis, no rose-colored spots. On Monday night he slept some. Delirium was moderate, and like that in typhoid fever; he kept trying to get out of bed, and saying that he wanted to go home. From this time he grew rapidly worse; the pulse increased in frequency, and became small and feeble; the diarrhœa continued, and he died from exhaustion on Wednesday evening. The temperature on Wednesday was 101½° F. in the axilla, and at that time the extremities were cold." Such was the history of the case, and now for the circumstances which are responsible for his death. "His room was upon the second floor, was fifteen feet square, had a high ceiling, and had two windows. One window opened into the back yard, the other into the vestibule of the water-closet, used by 70 or 100 persons. The closets were very foul, had no ventilation except by a square box, to which was attached a pipe about six inches in diameter, running horizontally through the room occupied by my son, and emptying into the chimney. The stench from these privies was something horrible." In this case it is uncertain whether the disease came from the gases which were produced in the privies or from contaminated water, as no investigation was made with reference to the latter question.

At one of our watering-places, however, only a few years ago, there were repeated cases of a similar disease, a disease having the same symptoms substantially, and they were traced distinctly to a communication between the pipes from the water-closet and the pipes which supplied the house with water. There was a pretty clear solution of the sickness. It must have been caused by water contaminated with human excrement. The disease is not the "typhoid affection," so far as we can judge from the symptoms. Its lesions are not yet fully studied.

Whether the disease which occurred in eighteen out of the twenty persons who attended a picnic in Connecticut was truly typhoid fever, or was of the character of the cess-pool fever, I have not been able to ascertain.

These cases come from every region of the country. Not long ago I saw a case which came from the White Mountains, and it would seem that discharges from privies, or emanations from them, can produce this form of disease anywhere.

There is no treatment for it except symptomatic. You will endeavor to stop the diarrhœa, and for that purpose you will use exactly the same means employed to suppress a diarrhœa arising from any other cause.

Naturally you would consider the source of the disease and remove that, and doubtless the use of some disinfectant will be suggested to you. Small doses of carbolic acid may be given, but it is not certain that it will produce decided results. At the same time it can be given with safety, and it is proper that it should be administered. The hyposulphites, of soda particularly, the bisulphites and the sulphites, may all be used for the same purpose. It is probable that they may do some good. The gravest feature of the disease is the exhausting diarrhœa: and this suggests the use of brandy or port wine. In one case that I saw transfusion of blood was made, but with only temporary benefit. There is no general febrile movement of much severity; consequently, quinine would be required more as an antiseptic than as a sedative.

TYPHO-MALARIAL FEVER.

There is another form of fever to which I wish to direct your attention, and it is that which Dr. Woodward, of Washington, has described under the name of typho-malarial.

I have long known that a certain relation existed between malarial disease and typhus and typhoid fevers, but it did not occur to me to give it a name. To give you an illustration, which is perhaps better than a general description: in 1847 a young physician in Bellevue Hospital was taken sick with typhus fever. He was from a malarious region, and a year before had had remittent fever. His typhus fever went on, not with extreme severity, nor was it light enough to relieve anxiety. In the course of two weeks I found him, at one of my visits, in profound coma. What had happened I was not able to say. Whether there had been a sudden accession of meningitis, or whether the condition was due to some unexplained cause, I was not at first able to determine. After three or four hours he began to recover from his coma, and in a short time was quite himself again. That fact in an adult would exclude the idea of meningitis. The question then came, Can there be any malarial influence at work to produce this congestion of the brain?

On inquiry I found that about one year before, while living in the neighborhood of Philadelphia, he had an attack of remittent fever. I immediately began the administration of quinine; but the coma recurred the next day, in a milder form, and by the third day was wholly conquered. After this the typhus ran its regular course, and he recovered. Symptoms as severe as this do not commonly occur in typho-malarial fever, but accessions of fever are very apt to correspond with the accessions in the intermittent and remittent fevers —that is, the highest temperature is more apt to be present in the morning than in the evening. In other words, malarial poison will work in conjunction with typhus and typhoid poisons and make a compound disease. Of course, your treatment in such cases will be modified to correspond with the complication. By use of quinine the malarial element can be pretty promptly eradicated, without producing any special effect upon either the typhus or the typhoid fever. Your treatment, therefore, will be antiperiodic as well as sustaining.

Original Communications.

ON TRUE ANIMAL VACCINATION.

By HENRY A. MARTIN, M.D.,

BOSTON, MASS.

In a previous communication I endeavored to give some idea of the causes of "shocking results" erroneously attributed to vaccination. I have had ample experience in the investigation of such cases and of the often very incorrect, imperfect, and exaggerated rumors and reports of them since I was summoned, in 1860, as an expert, to the inquest on "the Westford cases," till the present moment. I feel much as did that great, good, and all too soon and too completely forgotten man (the "Jenner of America"), Doctor Benjamin Waterhouse. Having imported into America a new disease (*Vaccinia*),* he felt obliged to investigate and explain every circumstance connected with it. In September, 1870, I introduced into America the method of *true*† animal vaccination, and have felt a peculiar necessity and obligation to investigate most thoroughly every report of ill result from the use of bovine virus. The cases in which uncomfortable complications and results, or even mere *sequelæ* of the use of true animal vaccine have been reported, have been extremely few, yet the investigation of them has involved a great amount of very irksome labor. I am happy to say that *in every instance* in which fatal or even serious results have been reported as complicating or following the employment of *true* bovine virus, the report has been erroneous, and I regret to say that, in more than one instance, the error has arisen from intentional and interested misstatement, which has only been revealed when it became evident that further misrepresentation would have been worse than useless. Although I possess, and can at any time produce, ample evidence to corroborate the truth of this statement, I have not, hitherto, considered it worth while to formally refute the very few reports unfavorable to *true* animal vaccination which have been published.

Such refutations involve, necessarily, a great deal of explanation, a vast amount of writing, laborious to the writer, and very seldom carefully read, or indeed more than glanced at, by the "busy practitioner," and have but very little effect in neutralizing the ill consequences of the original misrepresentation. The original short, crisp, piquant lie, even although its source may be unknown, irresponsible, or even anonymous, will be read, and, if not fully credited, will still produce a decided and lasting impression and prejudice in the minds of ten readers, of whom perhaps, indeed, probably hardly one will take pains enough to investigate its credibility or even to carefully read a denial, which to be conclusive must almost necessarily be very long. Long and repeated experience having fully convinced me of all this, I have been satisfied to possess the documentary and other evidence necessary to vindicate *true* bovine vaccination from all injurious imputations hitherto made without writing any formal paper with that intention. The total number of cases in which ill results are even reported as, at any interval, following the use of *true* animal vaccine is so utterly and insignificantly small, compared with the prodigious aggregate of vaccinations and re-vaccinations made with that virus in America since September 28, 1870, that, if they were ten times as numerous, and all absolutely authentic (as I pledge my honor to, if necessary, prove them to be false), they might well be disregarded. Few of your readers can probably have an absolute or even approximative knowledge of the perfect revolution effected by true animal vaccination in America in the past seven years. If this revolution in practice had been associated with the operations of some extended and dignified organization like the National Vaccine Establishment of England, and its progress recorded, from year to year, by the publication of able and imposing blue-books and essays, and statistical tables, it would doubtless have made more noise in the world and produced an infinitely greater effect on some weak minds, but it could not have been more complete.

As a result of the general intelligence and education of the American people, the independence of the American profession, and a general conviction with both that vaccine virus *might* be the vehicle of human disease; but, above all, that by long human transmission it had lost much of its power to induce a perfect and permanently protective form of *vaccinia*, there was a very general willingness, and even desire, to give a fair trial to a method which was certainly free from *some*, and might be free from *all* the defects of the "Jennerian," or "arm-to-arm" method of vaccination. During the summer of 1870 I experimented in the vaccination of animals and of the human subject with virus thus obtained, and in September of that year I offered to the profession an opportunity to obtain true bovine virus. On October 20, 1870, I published, in the *Boston Medical and Surgical Journal*, brief announcements to that effect, with statements of the results of observation to that date. Two or three

* If it were not from a fear of appearing pedantic, I should use the original and proper term, *Vaccina*, which may be found in most of the older authorities. There seems no reason but a mistaken notion of euphony for the change in the final syllable; but why not Scarlatin*a* Varicell*a*, etc., etc.?

† I use the term "*true* animal vaccination," as that of "animal vaccination" and "bovine vaccination" are applied to the method of retro-vaccination (the vaccination of animals with humanized virus, and employment of lymph so obtained), a very different thing from true animal vaccination, and the very and deservedly bad reputation of which has been a great stumbling-block to the understanding and acceptance of the latter. By "*true* animal or bovine vaccination" is always to be understood the inoculation of a young selected bovine animal with the virus of original spontaneous cow-pox, of another from this, and so on in continuous series, as a source, and the only source, of supply of virus for human vaccination. A very common error is to confound with this "*variolo-vaccination* (inoculation of bovine animals with the virus of human *variola*), a method always uncertain and never safe, and which can never be of any *practical* value or importance

months after this Dr. F. P. Foster obtained virus from me, and commenced the propagation and sale of bovine virus in New York. Dr. Griffin, of Fond du Lac, Wisconsin, commenced the same laborious specialty, with instructions and virus supplied by myself. The variolous epidemic then prevailing creating an extraordinary demand for virus, a very large number of individuals, mostly physicians, engaged, in different parts of the country, in the propagation of the Beaugency cow-pox on animals of the bovine species. The consequence of this was that ample supplies of virus were easily attainable, and an unprecedented panic and wish to be vaccinated and re-vaccinated accompanying the progress of the epidemic led to a rapidity and thoroughness of protection of the entire population from *variola*, never before even distantly approached in this country, or even Europe, and indeed not possible, unless with the supply of virus (only limited by the demand) afforded by the method of animal vaccination. The immediate result of this general and thorough vaccination of the population of the United States with bovine virus is the present wonderful immunity from variolous disease—an immunity almost absolute, which has continued for three years, and which, I prophecy, will continue in a less remarkable and general, but still unprecedented degree, for from six to ten years longer. The only marked exception to this immunity from variolous epidemics since January, 1874, will be found in the epidemic in San Francisco, and, to a less degree, throughout California in the summer of 1876. The variolous epidemic which, with a malignity and mortality unprecedented in living memory, raged throughout the continent of North America from 1868 to 1873 (inclusive) made its first appearance on the Pacific coast, and continued throughout California during 1868–9 with terrific intensity and mortality till it had exhausted the entire susceptibility of the population.

What vaccination was done was necessarily with virus of very long humanization, and we have the official evidence of the late Dr. Rowell, Health Officer of San Francisco during the whole of that dreadful visitation, that the general vaccination and re-vaccination of the population was totally without effect in arresting the pestilence, and Dr. Rowell's opinion is very decidedly expressed that vaccination during that epidemic rather predisposed the patient to the attack of variolous disease than prevented it.* This want of prophylactic efficacy Dr. Rowell attributed to extraordinary epidemic influence, and not at all to any defect in the virus employed, "which was of the old stock, *humanized*, and believed to be as good as that used in any portion of this country or elsewhere." The population of San Francisco ravaged by small-pox in 1868–9, and very generally vaccinated during these years with virus of long humanization, became subject again in 1876 to a similar epidemic of equal malignity. On this occasion, but not till the epidemic had attained very formidable proportions, a general vaccination with true bovine virus was ordered, and very thoroughly and rapidly accomplished.

All, or very nearly all, the virus used was of the Beaugency stock, and the report of that general vaccination, in direct contrast with that of the same population exclusively with long-humanized virus, is one of the most important sanitary documents ever published. I will make but brief quotation from the report at this time, but hope that my allusion to it may attract the attention of the profession, and lead to a more perfect and extended appreciation of the very remarkable and important facts it records.* After relating Dr. Rowell's experience, and opinions of the effect of the general vaccination in 1868–9, Dr. Meares says: "We have just passed through an epidemic of equal malignancy, and of almost equal fatality, and yet how different is the experience of your present health officer from that of the late Dr. Rowell in regard to the prophylaxy of vaccination! I wish to place on record the emphatic declaration that of the many thousands successfully vaccinated by this Department, and by practitioners generally of this city, with bovine virus (Beaugency stock), not one has been attacked with small-pox, notwithstanding these vaccinations have been performed during the prevalence of an epidemic of a most malignant and fatal character." In another place: "I have found it, in my large experience—having personally handled more than fifteen hundred cases of small-pox during the year, and having personally vaccinated hundreds who, for weeks, were daily and hourly exposed to the contagion—absolutely protective, where the patient was vaccinated before the period of incubation of small-pox, and, as I have elsewhere stated, where the period of incubation had been going on for several days, the disease has, in every case coming under my observation, been rendered entirely harmless by vaccination with bovine virus."† Again: "Erysipelas, axillary and pectoral abscess so seldom result from the use of bovine virus that no case of either has occurred within my knowledge." "There are, I know, some few medical men who continue to use humanized virus in preference to bovine. Fortunately for their patients the introduction and general use of bovine virus in the Eastern States and on the Pacific coast has furnished these gentlemen with virus but slightly removed from the animal. It is exceedingly doubtful whether any of the old stock of vaccine can be found in the United States."‡ Dr. Meares is no enthusiast or partisan. In

* "Report of the Health Officer of the City and County of San Francisco for the Year ending June 30, 1869, by Isaac Rowell, M.D., Health Officer," p. 23. I am under the greatest obligation to Dr. Meares, Dr. Rowell's successor, for a copy of this extremely rare and valuable report.

* "Report of the Health Officer of the City and County of San Francisco for the Fiscal Year ending June 30, 1877. By J. L. Meares, M.D., Health Officer." Dr. Meares very kindly sent me a large number of copies of this report, which I have sent to England and elsewhere. It is probable that copies may still be obtainable by application to Dr. Meares.

† The Boston Medical and Surgical Journal, in a notice of this report recently (Nov. 8), asks, after quoting this paragraph, "What, we would ask, does 'entirely harmless' mean?" To ordinary minds there does not seem much mystery or obscurity in the statement; but in an extremely interesting private letter to me Dr. Meares explains, and as the explanation is very instructive, I transcribe that part of his letter: "A case of confluent small-pox was reported in the person of a Mr. Casaboni, a policeman. I saw Mr. C. on Thursday, the third day of the eruption. He died in a few days. The attending physician had vaccinated the five really beautiful children of Mr. Casaboni before I visited the family. The Sunday following Mrs. C. sent a request that I would call and vaccinate the children. The attending physician was out of the city and his vaccinations had not taken. I visited the family and vaccinated the five children with the bovine virus. On the seventh day after I had vaccinated the children I was again called to see the family. Three of the children were quite sick. One of them, a fine boy, five or six years of age, was taken with fever the day before (the sixth day after vaccination), and the other two were taken with fever the same day I saw them (the seventh day after vaccination). When I saw the children the next morning, I found the little boy sitting up, eating an orange. He had a few papules on his face, and a few scattered over his body. He had no fever, said that he was quite well, and indeed was not sick a moment afterwards, the papules all having aborted. The next day the other two children had two papules each on their faces, and a few scattered over their bodies. These papules also aborted, and recovery was as rapid as it could have been from the mildest form of varicella. And this is what I mean when I say, 'even when the period of incubation,' etc. The other two children escaped altogether. I argued, at once, if this virus would so throttle this terrible disease after a period of incubation of at least four days in the case of the boy, and of three days in the cases of the two other children, besides having protected entirely the remaining two, that it was my duty to discard, as far as possible, the humanized, and substitute the animal, virus. Nor has it disappointed my expectations, as my report will testify."

‡ Dr. Meares's Report, p. 16.

a private letter he has informed me that, when appointed health officer, he had no experience of animal virus. A quantity, sent to the editor of a medical journal, came accidentally into his hands, and it was the remarkable effect that he witnessed from its use in a large family, already (six days before) vaccinated without effect with humanized virus, and for from four to six days exposed to the contagion of *variola*, that led him to its more extended use, an observation of equally remarkable results, and, finally, to the adoption of bovine virus exclusively in the general vaccination of the city.

I have said that the *immediate* result of the recent unprecedentedly complete vaccination of the United States is the present entire immunity from *variola* in an epidemic or endemic form, and, indeed, from sporadic cases unless imported; and it is very remarkable that in no instance, of many within my knowledge since 1873, has small-pox extended beyond the cases bringing the disease from Canada and foreign ports; and here an important fact may be mentioned. Canada has continued, since 1873, to be the field of small-pox prevalence; and in Canada, although bovine virus has been extensively employed in *private* practice, the old humanized stock from England and elsewhere is still extensively used, and all the *public* vaccination, with very trifling exception, has been done with virus of a greater or less degree of humanization. What may prove to be the more enduring effect of this great experiment is only to be surmised now, but can be clearly established by time alone. The whole population of the United States was most thoroughly vaccinated during the years 1871, '72, '73. This vaccination was done with virus direct from the heifer, and with very early human removes therefrom, for it is certain that the amount of long-humanized virus used during those years was inappreciably small, and it is not probable that during 1873, and from that till now, a particle of vaccine virus of *long*-humanization (5 to 79 years) exists in the United States.

Those gentlemen who have seen fit to oppose true animal vaccination from its inception, without anything like proper or practical investigation, are still practising it and enjoying its benefits, for the most enlightened advocates of the new method do not insist that a few human removes from the animal essentially impair the prophylactic efficacy of vaccine virus, but that by a *long* series of such removes it *is* very seriously and vitally influenced and impaired. A single human remove *may* be syphilitic. And virus of even one human remove has not that wonderful exemption from erysipelas noticed in that *direct* from the animal; but it is not certain, or indeed probable, that one, or even ten, human transmissions essentially impair its most important quality. Even those who exclusively employ bovine virus do not assert this; and one of the great advantages of *true* animal vaccination is that it enables the practitioner to obtain at will heifer-transmitted cow-pox virus, and in this way to renew his "strain" of vaccine, and to be absolutely cognizant of its entire human pedigree. If, when the next variolous epidemic shall occur, it shall be found that the probably at least 10,000,000 people vaccinated and re-vaccinated in 1870–6 with true bovine virus, direct from the animal or of very early human removes, are absolutely protected from small-pox, or protected to a degree and with a permanence far beyond that attained by the use of virus of long-humanization, the victory of the new method will be complete and absolute. Then, too, may be definitely settled whether, as is not probable, a few human removes essentially impair the prophylactic efficacy of vaccine virus. It must be admitted that few experiments have been on a more extended scale, or of more prodigious importance to humanity for all future time than the recent very general vaccination of the people of America. Few men, if that experiment results, as the writer most fervently and firmly believes, will deserve the enduring gratitude of their species more than those who, through good and ill report, and a very unfair share of the latter, have upheld and labored for the extension of true animal vaccination.

If this method was the means of supplying virus, no more efficacious than that obtained by the "arm-to-arm" method, there are still reasons why the innovation should be regarded as of very great importance and value. I will briefly allude to three of these reasons.

1. The ability of true animal vaccination to afford, at a few days' notice, supplies of virus utterly unattainable by the old method, and limited only by the demand. As formerly in America, now in England, during variolous epidemics, the immediate demand for virus is far beyond the supply. Virus is taken from poor and spurious vesicles; from perfect vesicles by repeated tappings and drainings, day after day; from vesicles at too advanced a stage; from secondary vaccinations, and, as a notorious result of all this, there are made an immense number of spurious and quite unprotective vaccinations. One of the most fertile causes of the prevalent discredit of vaccination, is the impairment of the protection of those whose arms have been robbed of lymph and the full development of the vaccine disease interfered with. During the late variolous epidemic in England, every issue of every medical journal contained paragraphs, editorials, and communications headed "Vaccine Famine," loudly complaining, in spite of the very admirable and most efficient and energetic National Vaccine Establishment, of the almost utter deficiency in the supply of vaccine virus; so inadequate was all that could be obtained to meet the immediate and great needs of such an occasion. It is notorious that, if the epidemic had not suddenly and unexpectedly subsided, this great and crying "famine" would have led, notwithstanding official red-tape opposition, to the adoption, as a temporary expedient, of true animal vaccination. If this had been done, the new method would have become the established and only one of vaccine supply in England, and in precisely this way *will* true animal vaccination eventually be introduced and established in our good old motherland, whose conservatism is so safe and so preventive of much that is evil, that we can almost excuse her for what sometimes seems unreasonable obstructiveness of what is desirable and good.

2. The entire immunity of vaccination with true bovine virus, direct from the animal, from erysipelas. This quite unexpected immunity was first noticed by myself and others, within six months after I introduced the new method. I published it in March, 1872,* and have repeatedly alluded to it in various publications since that date. During the thirteen years that I furnished humanized virus exclusively to the profession (1857–1870), I issued an annual average of about 25,000 "charges," and must have received from correspondents notifications and complaints of over one hundred and fifty cases of vaccinal erysipelas, besides occasional cases of axillary abscess, and many cases of the irritable spurious vesicle.

* Report of Special Meeting of Physicians to investigate Animal Vaccination, March 9, 1872, Journal of the Gynæcological Society of Boston. Numbers for April and June. 1872.

During the somewhat over seven years that I have supplied bovine virus, I have issued an average of over 150,000 "charges" annually (450,000 in one year, 1872–3), and have had but two reports of erysipelas, and none of abscess or of the irritable spurious vesicle. The two cases reported were: one in which, twenty-one days after vaccination, a physician tried to remove two crusts—one came off easily, the other he endeavored, with undue force, but ineffectually, to remove. He was sent for the next day, and found that erysipelas had begun at the edge of the crust he had vainly tried to tear away. In the other case a patch of mild erysipelas (erythema erysipelatosa) was perceived on the left foot of an infant vaccinated on the right arm six hours before. I do not think that either of these cases can, in any way, be attributed to vaccination, but they are, literally and absolutely, all that have been reported to me, or that have come to my knowledge as *sequelæ* of vaccination with true bovine virus.* I have been informed that statistics carefully kept by the New York Dispensary, and by its predecessor, the New York Kine-Pox institution, for a great many years, and covering an immense aggregate of vaccinations, show an average of one case of erysipelas in 500 vaccinations with humanized virus, and my own very large and long experience in the use of that virus fully confirms these statistics. The reader can readily approximatively calculate the number that, at this rate, should have been reported to me from the use of far over 1,000,000 charges of animal virus. One thing more I wish to say of vaccinal erysipelas. It is a gross mistake to suppose that this affection, complicating vaccination with humanized virus, is, in any way, a proof of the bad quality of the virus employed, or of the morbid condition of the vaccinifer yielding it. On the contrary, almost every case I have seen, and I have seen many, has complicated a peculiarly perfect development of *vaccinia*, from the use of virus from an unexceptionable *vaccinifer*, in whom erysipelas had never appeared. I do not remember or think that I ever saw a case of vaccinal erysipelas, in which the vaccinifer manifested that disease. Vaccinal erysipelas is simply an *accident* of vaccination with humanized virus, which no amount of knowledge or care can avert. It is, as I can prove by many instances, peculiarly apt to appear, just as the *areola* declines, in cases in which the development of *vesicle* and *areola*, particularly the latter, has been typically fine and perfect. Every vaccinator (with humanized virus) of large experience will fully acknowledge and confirm the truth of what I have written, and from his own experience recall how great an annoyance this accident always is, what vast trouble and anxiety it gives, and, above all, what unjust and often seriously injurious aspersions its occurrence is apt to occasion. If immunity from erysipelas were the only recommendation of bovine lymph, it would be a very great one. I unhesitatingly assert that immunity, an immunity absolutely total, for the two cases which have come to my knowledge were not cases of *vaccinal* erysipelas, and the occurrence of a thousand *just* like them would not invalidate the truth of my assertion.†

3. One other advantage of bovine vaccination is its freedom from liability to induce the irritable, spurious *vesicle*. This I have verified by many hundreds of primary vaccinations made with bovine virus and that of the *long*-humanized "stock" of the English Vaccine Establishment, each on one arm of the same patient. Very often I have seen, on the humanized side, a vesicle more or less, and sometimes completely irritable and spurious, while on that arm vaccinated with bovine virus there has been *invariably* a perfect development of the disease, regular in all respects of duration and intensity in the development of the *vesicle* and *areola*, and also in the very important, but now almost entirely overlooked, process of "scabbing," the formation of a crust or scab of exactly characteristic form and color, which has remained adherent for at least twenty-one, and usually for over twenty-five or a greater number of days, while on the humanized side, anything like a typical vaccine crust has very often failed to form at all, and, in many instances, the seat of the *vesicle* has been occupied by an ulcerated surface covered by a thin, soft crust, frequently removed and as frequently renewed. I need not, however, expatiate on the various forms and degrees of the imperfect vaccine vesicle; every vaccinator with humanized lymph is perfectly familiar with them. Pure, perfect, true bovine lymph has never, in primary cases, in my experience, induced those irregular developments, but, invariably, a perfectly regular and typical form of *vaccinia*. I have alluded to this very important fact in my report in 1872, and in several other publications, and at length in a report on animal vaccination which appeared in the recently issued volume of the Transactions of the American Medical Association. I have also stated in these various places, as a result of these experiments of vaccination of a single subject with both sorts of virus, the occurrence of erysipelas in several cases, and *invariably on the humanized side*, and also the fact that the cause of my final abandonment, forever, of the use of vaccine virus of even a single human remove, was the occurrence of erysipelas in five such cases in February, 1873,* and I will not enter into further detail now, but simply repeat the statement that I never saw or knew the irritable spurious vesicle to appear as a result of *primary* vaccination with *true* bovine lymph. It would be very hard to overestimate the importance of the three ascertained advantages of *true* bovine vaccination to which I have alluded, and neither of them is so important as its diminished liability to induce irregular and unprotective forms of vaccine eruption. The spurious irritable primary vesicle extensively observed, both in

* For two years and a half after I introduced true animal vaccination, I issued also virus of *one* human remove, and that of the old long-humanized "stock." During that period I received reports of several cases of erysipelas. Since I ceased myself to use virus of even one remove I have issued, to a few correspondents, crusts of a single remove. From the use of one of these, two cases of erysipelas were reported.

† The term *erysipelas* is most loosely applied to the results of inoculation of septic poisons, of pus, of diseased secretions, from exposure to cold, and often to mere erythema, and even to a full and peculiarly perfect development of the *areola* of *vaccinia*. The term *vaccinal erysipelas* is only properly applicable to erysipelatous disease appearing at and spreading from the vaccine punctures or incisions between the time vaccination is done and the *undisturbed* scabbing of the *vesicle* and fall of the crust. It is *not* applicable to cases in which patches of *erythema* or *erysipelas* appear at some other part of the body in a few hours after vaccination of the arm, or to cases in which a vaccine crust is wrenched from the arm with even moderate violence. It is not pretended that in a patient with latent *erythema* or *erysipelas* vaccination will prevent its eruption. It *may*, indeed very certainly *does*, hasten such eruption or that of eczema or any other latent cutaneous affection. Neither is it pretended that even true animal vaccination is prophylactic of erysipelas. Formerly I held the theory that, in all cases in which erysipelas complicated vaccination, it was simply latent in the *vaccinee*, and would have appeared at any scratch or incision, and that it appeared in vaccination almost always as the *areola* declined, because, till that time, its development, in accordance with "Hunter's law," was kept in abeyance by that of the vaccine disease, the entire true pathological existence of which terminates with the decline of the *areola* (proved by the fact that the eruption of measles and scarlet fever, complicating vaccination, appears with the decline of the *areola*). This theory of mine has been modified, if not exploded, by the immunity of bovine vaccination from this pest.

* "A Few Words on 'Unfortunate Results of Vaccination,' by Henry A. Martin, M.D." Boston Medical and Surgical Journal, February 1, 1877.

England and America, at the very dawn of vaccination, gave rise to infinite trouble and confusion, and from the frequent cases of small-pox following it, almost sealed the adverse fate of that blessed innovation. Nothing but the wonderful good sense and shrewd observation of Jenner and Waterhouse saved its reputation. Since that time it cannot be doubted that much of the discredit into which vaccination has certainly fallen, and the enormous prevalence, *particularly in this country*, of post-vaccinal *variola* and *varioloid* within very short intervals after nominal "vaccination," has been and is due to the great proportion of imperfect and even quite unprotective results from the use of virus which, through very long humanization, or collection at improper periods of the disease, or careless selection of *vaccinifers*, or vicious methods of preservation, has become deteriorated and effete.

I have thrown these remarks together without much method, more with a view to calling the attention of the profession to questions now very ripe for discussion and of extreme importance, rather than with any notion of winning personal reputation as a writer. The report to which I have referred, in the last (xxviii.) volume of Transactions of the American Medical Association, is quite voluminous. To that report I refer such of my readers as may desire further and much fuller information on subjects which seem to me of unapproachable importance.

I have devoted a long professional lifetime to the study of vaccination, in the hope of helping in a humble way in the extension of a great, but most inadequately appreciated blessing, and in throwing some light on problems connected with it as yet imperfectly or not at all resolved, and thus, in a distant and remote way becoming associated with the fame of Jenner and Waterhouse, to whom, in every city of Europe and America, should, long since, have arisen memorials in "everlasting bronze."

To this ambition, since the introduction of true animal vaccination, I have devoted every day and hour, have sacrificed a practice, the laborious accumulation of twenty-five years, have waived the rewards and attractions of more brilliant and pecuniarily profitable, and far less laborious and difficult, fields of professional and literary effort. If, in return for all this ceaseless labor, I shall reap for myself the satisfaction of being recognized as an efficient agent in firmly establishing *true* animal vaccination in America, and, for this country, the credit of being the first in which this infinitely important and beneficial innovation was first calmly, dispassionately, and fairly investigated,* and, as a result, firmly, permanently, and exclusively adopted, I shall be repaid, much more than a thousand times repaid, for all the efforts and sacrifices I have made.

27 Dudley St., Boston, March 1, 1878.

* True animal vaccination, as a source and method of vaccine supply, was very unfortunately first introduced in France (in 1866) by the eminent Professor Depaul. Before there had been any sufficient experience in its practice to ascertain its difficulties and overcome them, it became a subject of the most absurdly violent and protracted discussion in the Academy of Medicine, and the defects due to this want of experience were criticised with a vindictiveness and passion peculiar to the nation, and savoring far more of personal antagonism and even hatred than of a calm desire to perfect a new method and then fairly judge its merit. The method of retro-vaccination which preceded it (introduced into Paris from Italy by Dr. Lanoix in 1864) was practised in a very quackish manner, and with a view to private aggrandizement and profit, far more than to scientific progress. All the circumstances amid which animal vaccination was introduced in Paris to the notice of the rest of the world were unfavorable and calculated to give an unfair and distorted impression of a method which has, however, in Belgium and this country been, since that time, more calmly studied and more justly judged.

SOME REMARKS REGARDING

ABSCESS OF THE LIVER, OPENED ARTIFICIALLY THROUGH THE ABDOMINAL WALL, FOLLOWED BY COMPLETE RECOVERY.

WITH IMPERFECT NOTES OF TWO CASES SIMILARLY AFFECTED, BUT NOT RECOGNIZED AS SUCH DURING LIFE, TERMINATING IN DEATH.

By RUDOLPH TAUSZKY, M.D.,

of New York.

The exceedingly interesting paper on "Abscess of the Liver," which Dr. Davis read before the N. Y. County Medical Society, on Monday evening, the 25th of February last, proved to my mind conclusively, as it must have convinced all those who were present at that meeting, that the method of relief advocated so ably by him, viz.: that of opening such an abscess boldly, as soon as its presence can be ascertained, without first taking any preliminary steps for the purpose of causing the anterior surface of the liver to become adherent to the abdominal wall by a preliminary operation, as has been done by some eminent surgeons in many instances, and recorded in the literature on this subject, is the best, the safest, and the most reliable mode of giving the patient thus affected a chance for life. Surgeons operate now successfully for perityphlitic abscess. We evacuate purulent collections safely to the great benefit of the patient by surgical means from the pleural cavity. Why neglect to do the same in a case of collection of pus—with or without the formation of a so-called pyogenic membrane—in the abdominal or pelvic cavity, or in any of the organs located therein? My friend, Dr. Leonard Weber, has operated successfully four times for abscess of the vermiform appendix, on persons who would certainly have died without such operative procedure.

Fortunately, the occurrence of abscess, or abscesses of the liver, is with us, in the United States, a rare disease. I have ascertained from the records of the Bureau of Vital Statistics of the Board of Health of this city, that during the past five years there were returned to it fifty-four certificates of death, the causes of which having been given as "abscess of the liver." In 1873 there were 13; in 1874, 14; in 1875, 12; in 1876, 3; and in 1877 there were twelve deaths ascribed to this cause.

Most physicians have no doubt met with abscess of the liver in post-mortem examinations in pyæmia, or septicæmia, or, as a consequence of the dissemination of particles, or germs if you please, as emboli in the liver, the spleen or the lungs, from sarcomatous growths of the skin or other organs, these being transported there, as Rudolph Virchow has shown, by the tumors growing into the blood-vessels from without. Small particles are thus constantly being washed away by the current of the blood coming in contact with them in accordance with the law, "gutta cavat lapidem non vi, sed saepe cadendo." The drop excavates the stone, not by its force, but by its repeatedly falling upon it. These particles are often carried by the blood-vessels into the liver, and not by the lymphatics—as is the case in carcinoma, for instance—thus causing emboli, around which abscesses form. We meet with abscesses of the liver, as is well known, as a sequela of hepatitis, hepatic cysts, *hydatids*, calculi, or as a consequence of fevers. Rarely we meet with this affection occurring after gunshot, stab, or cut

wounds. Since these traumatic causes are soon followed (in most instances at least) by death, before an abscess had time to form.

As stated by Dr. Davis and Sir Thomas Watson (in his celebrated work, entitled "Lectures on the Principles of the Practice of Physic," London, 1866, where, page 964, an excellent description of the subject under consideration may be found), in the tropical regions this formidable disease is not very rare, for the reason of the climatic and antihygienic influences being favorable to its occurrence. Dr. Davis, if I mistake not, has collected two hundred and eighty well-authenticated cases of hepatic abscess—most of which proved fatal, the majority of these cases at least. No one of the gentlemen present at the meeting of the County Medical Society, above referred to, mentioned having seen any case or cases of abscess of the liver, when the subject came up for discussion, with the exception of myself. The hour for an adjournment having arrived, I did not feel justified in detaining the Society, and I simply briefly referred to the only case I had met with during my connection with the U. S. Army medical service, in which an operation for the evacuation of an abscess of the liver through the abdominal wall was crowned with success, and was followed by complete recovery of the patient. I met with this, to me, remarkable case in 1862, in the month of December, in the person of a U. S. soldier, who was brought to Harewood (U. S. Army) General Hospital, in Washington, D. C., with about seven hundred other sick and wounded, after the unfortunate battle of Fredericksburg, Va., under General Burnside. This man presented symptoms, commonly denominated as hectic. He was extremely emaciated and prostrated, he vomited frequently and was partly delirious. High fever was also present. It was self-evident that the man had but a few days to live at the furthest. A careful examination revealed the fact that he had a deep-seated abscess of the liver. All the surgeons of the hospital, myself among the number, connected at that time with the Harewood Hospital, of which Dr. Thomas Antisell, Professor of Georgetown Medical College, Washington, D. C., had charge, agreed as to the correctness of the diagnosis, but, although at that time from half a dozen to a dozen capital surgical operations were being performed in the hospital daily, none of us dared to plunge a knife into the man's liver, for fear of perhaps killing him instantly by such a procedure. Only one of our number, a Dr. Hirschfield, whom I have not seen since 1863, boldly opened the abscess through the abdominal wall; a pint or more of pus was thus evacuated, and the patient's symptoms gradually improved. After a few weeks' careful nursing he entirely recovered. To my knowledge this case has never before been placed on record. I wish therefore to add this one successfully treated case of "abscess of the liver," to those already published by others, as having come under my personal observation, and to place it on record through the columns of your esteemed journal. I regret only that the full history of the case has escaped my memory, since it occurred more than fifteen years ago.

With our present mode of making exploratory punctures, and of using Dieulafoy's aspirating needle, and the use of the carbolic acid spray, the utility of which is to-day admitted not only all over Germany, Austria, England, and other countries, but also in our own, where Prof. Lister's method is gaining ground from day to day, no surgeon should, in my humble opinion, hesitate for one moment, where human life would be endangered by delay, to open any abscess occurring in any part of the human body, as soon as its presence has been ascertained beyond a doubt, and even in abscess of the liver we need not wait, as advised even by that great English teacher, Sir Thos. Watson (loco citato), for an adhesion of the liver to the abdominal wall to take place before having recourse to an operation. In this I fully agree with Dr. Davis, above referred to, who made this the punctum saliens of his paper, read before our County Society.

That there are many cases that die of abscess of the liver without having been recognized during life, there can be no doubt. I have but recently heard of the death of a gentleman of my acquaintance, who went by the name of "Uncle Ralph," and who lived with his relatives, a family named Schaeffer, in 50th Street in this city, between the 8th and 9th Avenues. This patient had been sick but two weeks before he died. He had vomited incessantly, and was delirious most of the time during his last illness. He was attended by two surgeons, friends of mine, Dr. C., of W. 45th Street, and Dr. R., of Abingdon Square, in this city, and had the late Dr. K. in consultation with them. These eminent surgeons diagnosed the case as one of perforation of the intestine. Only upon the body being opened post-mortem they found that an "abscess of the liver" had killed the patient. This man was not quite fifty years of age, and had never been ill in his whole lifetime up to his last illness, just mentioned, of which he died—with the exception of an attack of a violent colic, with obstinate constipation, lasting for several days, two years previous to his death, at which time Dr. C., I am told, removed a large biliary (?) calculus from his rectum.

After the removal of this calculus he felt as well as ever until the last attack that terminated his life.

Whether other calculi found after death caused the hepatic abscess which had not been diagnosed during life, I cannot tell from the meagre data obtained from a relative of the deceased.

The third case was that of a surgeon, a graduate in medicine of the Bellevue Hospital Medical College, who, up to the time of his death, filled the position of house surgeon to the Mount Sinai Hospital in this city. This surgeon presented all the symptoms of typhoid fever, and had been treated for that disease from the time he was taken ill until his death, five or six weeks later. The post-mortem examination in this case also proved the presence of a very large hepatic abscess which had not been recognized during his lifetime, as far as I am aware, and was the cause of his death.

Dr. C. Murchison, in his "Clinical Lectures on Diseases of the Liver, Jaundice, and Abdominal Dropsy" (New York: Wm. Wood & Co., publishers, 1868, page 180 and seq.), relates the history of a case of abscess of the liver in the person of a soldier, æt. 33, under his care in November, 1853.

This author says: "The hepatic dulness in the right mammary line was eight inches, the increase being due to a projection downwards from the lower margin of the normal area of hepatic dulness. There was also considerable bulging of the lower right ribs. . . . On December 8th patient died.

"On examination of the body, ten hours after death, one enormous abscess was found in the right lobe of the liver. It contained upwards of four quarts of pus."

Dr. Murchison speaks, in his admirable work referred to, of pyæmic multiple abscesses and of the single "tropical abscess of the liver." His cases, XXXVII., XXXVIII., XXXIX., and XL., are described minutely. The first three of these died. The last one, No. XL., had been punctured with a large trocar, and recovered.

I adduce this statement of the eminent London surgeon in corroboration of the correctness of the practice which Dr. Davis has advocated, and which I desire to lay principal stress upon, namely to open any abscess, wherever accessible, as soon as its presence is made out beyond a doubt.

"Even hydatid tumors of the liver were tapped by Sir Benjamin Brodie many years ago, and the patients made a good recovery. See Murchison (loco citato), *Med. Chir. Trans.*, vol. xviii., p. 119. Successful cases were also published by Dr. Bright, and by many other observers."

Dr. Murchison also thinks it necessary to wait for the formation of adhesions between the tumor and the abdominal wall, or to endeavor to induce them, before puncturing, from fear of otherwise causing either, 1st, acute peritonitis, owing to the escape of a portion of the fluid into the peritoneal sac, or, 2d, from the admission of air into the abdominal cavity.

Prof. Austin Flint, in his "Treatise on the Principle and Practice of Medicine," Phila., 1867, also advises to open hydatid (or echinococci hominis) cysts by an incision into the tumor, which he considers warrantable only provided adhesions have taken place around the space in which the opening is made.

Dieulafoy's aspirator and Lister's spray obviate both these dangers.

SUCCESSFUL TREPHINING

FOR THE RELIEF OF CEREBRAL COMPRESSION FROM EXTRAVASATED BLOOD WITHOUT EXISTING LESION OF THE SKULL OR SCALP.

By W. B. RODMAN, M.D.,

FRANKFORT, KY.

In the *American Journal of the Med. Sciences* for January, 1877, I published a series of cases of "Head Injuries," and some remarks concerning their treatment, which seemed to me to be specially fit and appropriate. My conclusions from these cases prompted me to advocate a somewhat bolder resort to operative interference than is generally advised in the various modern works on surgery.

My experience, since the publication of that article, has served only to strengthen the opinions I then held. Again I refer to the writings of Gross and Erichsen, they having more influence over the practice of surgery in America than any other authors or teachers. The treatment advocated by the former for the relief of cerebral compression from extravasated blood may be found in vol. ii. (Ed. 1872), page 133, line 31, also page 142, particular attention being paid to the paragraph beginning with 12th line from the bottom of the page. The substance is, that if the extravasation of blood is uncomplicated by fracture of the skull, no one is justified in resorting to the trephine, but reliance must be placed in medical treatment alone. He reports only one case in which an operation was performed under these circumstances (and, therefore, contrary to the rule he lays down), and this case recovered. Dr. Physick was the successful operator.

Erichsen (Ashhurst's Ed., 1869), in the paragraph beginning with the 14th line from the bottom of page 354, allows more latitude than Gross. He dwells more than the latter upon the distinction to be made between the meningeal and cerebral form of extravasation, the diagnostic differences being described on the preceding page, under the head of Symptoms. He says, however, that instances are very rare in which an operation for the removal of extravasated blood, uncomplicated by fracture of the skull, is justifiable. He mentions only three cases in which operations were performed to remove extravasated blood. Two died, the third recovered. This latter, however, was complicated by a stellate fracture of the skull. It seems, then, that the case of Dr. Physick, mentioned by Dr. Gross, is the only one known to either Gross or Erichson, in which recovery took place when the extravasation was uncomplicated.

I think, therefore, that I am justified, by the rarity of the following case, in its publication:

Berry Henderson, colored, age seventeen, received, at 11 P.M., Sept. 24, 1877, a blow on the left side of the head two inches above and slightly in front of the ear, from a comparatively flat smooth stone. He was knocked down, but was able, with assistance, to walk home, a distance of several hundred yards. At 12 midnight Dr. Phythian saw him. He was then beginning to recover from concussion of the brain. There was neither scalp wound nor fracture of the skull, a slight contusion alone indicated the seat of injury. As there were no symptoms of compression, and those of concussion improving, the doctor left without doing anything for him. The next morning, at 9 o'clock, he was found by Dr. P. to have decided convulsive movements of the right side and serious symptoms of compression. These had commenced about 1 o'clock the night before, only a few minutes after the doctor had left. Purgatives, cold to the head, and large doses of the bromide of potassium were ordered. The two latter were kept up until late in the afternoon. The symptoms continuing to grow worse it was determined to cut down upon the skull and search for a fracture. The scalp being incised and reflected, no fracture could be found. In this dilemma the bromide and cold water were continued with the understanding that if the symptoms were not materially relieved by morning trephining should be resorted to. Morning came and with it an increase in the severity of symptoms. Upon consultation trephining was unanimously advised. The instrument was applied to the skull immediately under the contused scalp, the necessary incision having been made the day before. Upon lifting out the disc of bone the clot was plainly to be seen between the dura mater (which was uninjured) and the skull. There being some difficulty in removing the clot through the opening already made another disc was taken out. The clot extended in every direction beyond the edges of the opening. Only about an ounce of it could be removed, but we hoped that this, together with the relief of pressure from the absence of bone, would be sufficient. While the boy's condition was not improved as much as we desired, still there was sufficient abatement of the symptoms to justify the operation and lead us to expect recovery. In a few days he was out of all danger, and in due time fully recovered. He is now engaged in farm work near Frankfort. He suffers no inconvenience from any cause. That he would have died without operative interference is almost as certain as that he recovered with it.

I conclude that a surgeon is perfectly justified in trephining for the relief of compression of the brain from extravasation of blood (with or without accompanying fracture of the skull), provided, 1. That the clot is meningeal; for the necessary diagnostic differences refer to Erichsen, loc. cit. 2. That the clot can, with *some degree* of certainty, be localized. For instance, if a man is struck with a missile, injuring more from its *velocity* than *weight*, and extravasation is the result, I think it would be safe to trephine over the injured spot. If a man were to fall from cars in mo-

tion, from a horse, out of a window, or over a stairs, where the weight of his body produces the injury of the head—in other words, if the extravasation is possibly the result of counter-stroke, and upon examination no decidedly localized point of contact can be found, the propriety of trephining becomes very doubtful. That cases of extravasation uncomplicated by fracture in which an operation is admissible are *very rare* cannot be denied. But that all such cases should be treated on the medicinal or expectant plan I cannot believe.

FRANKFORT, KY., March 14, 1878.

Reports of Hospitals.

BELLEVUE HOSPITAL.

NOTES OF PRACTICE AND PECULIARITIES OF TREATMENT.

INTERESTING CASE—DIFFICULTY IN DIAGNOSIS—PROLONGED RECTAL ALIMENTATION.

THERE were certain points of interest worthy of note in the case of a married female patient, æt. 26, who entered the hospital on the 5th of January, 1877. Her family history was good, and there was no evidence of syphilis or intemperance. Through life she had had poor shelter, little food, and much abuse. During her first pregnancy an abortion occurred; had not carried a child to full term; had had three abortions in all, the last being two years ago. Prior to the last abortion she suffered severely from dysmenorrhœa and menorrhagia, but since that date those symptoms had been worse. She took cold while her menses were present, suffered from severe pains in the pelvic region, and was brought to the hospital in an ambulance. On admission she was recorded as a "pale, thin, delicate looking woman." She vomited occasionally, and suffered considerably from pelvic pains; was restless, moaned, and had an anxious expression of countenance. The abdomen was not tympanitic, temperature normal, bowels constipated, pulse fair strength, urine normal, and the uterus had a slight lateral displacement. Enema of castor-oil followed by suppositories of opium and belladonna.

January 6th.—Temperature 99¼° in the morning, and 100° F. in the evening.

January 7th.—Temperature 99¼° in the morning, and 98¼° F. in the evening.

Since admission to the hospital, the vomiting and pain were much relieved by the use of poultices over the abdomen, warm vaginal injections, opium, camphor, cannabis indica, etc. The pains were shooting in character rather than steady. Bowels kept open by enemata. Pains recurring, gtt. xv. of chloroform were administered with some benefit.

January 8th.—Temperature 99° in the axilla, 100° F. in the rectum in the morning, and at 2 P.M. 101¼° F.

Without known cause, the patient began to suffer from sharp pain in the lower part of the abdomen, burning pain at the epigastrium, and paroxysms of pain of great severity shooting through to the back. The pain became exceedingly severe, and was accompanied by a constant and almost uncontrollable vomiting. The material vomited was a watery fluid stained with bile, and finally eight or ten ounces of black fluid were thrown up, which contained blood-corpuscles, bile pigment, and mucus. Morphine used hypodermically was the only thing that had any effect in controlling the vomiting and pain. A blister was applied to the epigastrium. *Nutritive enemata* containing brandy, egg, U. S. solution of morphia, and milk, were repeated every three hours.

January 9th.—Patient much better; enemata continued.

January 10th.—Patient very comfortable. Temperature 101° F. in the evening.

January 11th.—Up to last evening the patient steadily improved; vomiting had ceased, and she suffered only slightly from pain. She was nourished entirely by nutritious enemata. The progress of the case was favorable when, seemingly without provocation, another severe attack of vomiting and pain came on with exacerbations as before.

The material vomited was, at first, clear mucus, but towards morning it was stained with bile. The legs were flexed upon the thighs, and the thighs upon the abdomen. Fomentations were applied to the abdomen; morphine was administered hypodermically in doses of 15 to 20 drops of Magendie's solution repeated every hour and continued several hours, but it gave but little relief, although the pupils were contracted, and it was thought possible that it was the cause of the moderate delirium which existed.

January 16th.—No fever; some thirst, and no appetite. Nutritious enemata have been continued, and morphine reduced to an occasional hypodermic of Magendie's solution. Catheterization necessary.

January 17th.—Shooting pains in the abdomen, but not so severe as before. Patient complains of a feeling as if there was a "lump" in the stomach; there is considerable thirst and occasional swallows of carbonated water are allowed, but no nourishment by the mouth. The bowels are loose, and it is with some difficulty that the enemata are retained.

January 18th.—The patient is considerably better; she has no fever; does not complain of hunger; not much of thirst; and her general condition seems good. Suppositories of opium and tannic acid are used one hour before giving an enema, and with good effect in way of relieving the irritability of the rectum. During the last *eleven days* she has been supported almost exclusively by rectal alimentation.

The points of interest in the case were:

1. The length of time the patient was sustained by nutritious enemata. The patient's general appearance in the mean time had improved in a marked degree, showing that the body had been well nourished.

2. *Diagnosis.*—How were the recurrences of intense pain to be explained? The fact that the pain when it recurred was paroxysmal in character militated against peritonitis. The fact that there was no fever present at any time was a still stronger evidence against peritonitis. Again, the length of time the patient had had the recurrences, the absence of tympanitis and rigidity of the muscles of the abdomen, favored the exclusion of peritonitis.

Still further, the patient was just as sensitive to touch over the chest as over the abdomen, and was exceedingly sensitive to pressure over the spine. Hepatic and renal colic were readily excluded, and the absence of permanent relief by the prolonged use of hypodermic injections of morphine excluded simple intestinal colic. The visiting physician was not prepared to say that it was not a case of gastric ulcer, and yet there was not sufficient evidence to warrant such a diagnosis, notwithstanding the hæmatamesis; the vomiting at times had been too prominent a symptom. At first it was not easy to exclude peritonitis. The case was regarded as one of well-marked neuralgic affection referable to the abdomen, recurring in

paroxysms and accompanied by irritability of the stomach—enteralgia. An attempt was to be made, on account of the irritability of the rectum, to return to the administration of food by the mouth, beginning with milk and lime-water in small quantities, and repeating them often.

February 1, 1878.—The patient, from the date of the last note, has been nourished almost entirely by the rectum. Several attempts have been made to return to alimentation by the stomach, but vomiting was produced, and an immediate return was made to nutritive enemata. The paroxysmal attacks of pain have recurred irregularly, probably as often as every two or three days, but they have progressively diminished in severity. There has been a notable improvement in the general condition of the patient, her lips present a very fair color, and the pulse is good.

The treatment has consisted in nourishing the patient; relieving the pain by the use of opium; usually administered in the form of Magendie's solution of morphine, ℥xx. hypodermically, and repeated every hour until relief is obtained.

The visiting physician did not yet feel that there was sufficient ground for making a positive diagnosis of gastric ulcer. The patient had vomited blood only once, there was no point at which tenderness upon pressure was specially marked, and the persistent irritability of the stomach could be explained on the ground that it might occur as a functional disorder.

February 2d.—Patient had an exacerbation of pain last night of moderate severity. Treatment as heretofore.

February 7th.—Patient had a slight attack of pain last night. Blister behind the ear relieved the headache.

February 12th.—Patient had a slight attack of pain on the 9th, but has had none since; is hungry, sits up in bed, rarely vomits, and her general condition is improving.

February 13th.—Nutritive enemata discontinued. Quinine by the rectum continued. Patient very comfortable.

February 20th.—Patient greatly improved; sits up for several hours at a time; has occasional attacks of pain at night, but hypodermics of water relieve them and send her to sleep. Record discontinued.

Progress of Medical Science.

QUINETUM AND ITS THERAPEUTICAL VALUE.—The name quinetum was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The only malarious disease in which quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, quinetum cannot be used in it as a substitute for quinine.

2. In all forms of pure malarial intermittent fever, quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

3. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

4. Quinetum never causes noises in the ears.

5. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

6. The influence of quinetum in chronic cases is greater than that of quinine.

7. The tonic action of quinetum is similar to, and perhaps even greater than that of quinine.

8. The action of quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.—*Practitioner*, February, 1878.

VISCERAL AND PARIETAL HYDROCELE.—Mr. Samuel Osborn, F.R.C.S., has published, in pamphlet form, an article on "Hydrocele of the Tunica Vaginalis," which he divides, according to origin, into visceral and parietal hydrocele. The former depends upon an extension of inflammation from the organ to the membrane; the latter may arise from traumatism, and is the form usually found in old persons, where it arises from relaxation of the vessels and tissues generally. The testicular sensation is frequently absent from the visceral variety, when secondary to some form of architis. The division of the treatment into palliative and radical is scarcely correct, for the former occasionally cures, and the latter frequently fails. Out of fifty-four cases treated by injection of iodine, nineteen had been previous iodine failures. Of these fifty-four, twenty-five have been followed up, and seven found intact, the other eighteen having refilled; two of these were of the original nineteen failures. The various other substances used for injecting by different operators are mentioned, including glycerine and carbolic acid, used by Dr. Lewis, of Philadelphia. Excision of a portion of the tunic, he mentions only to deprecate. The old method by incision should only be performed for the removal of loose cartilaginous bodies, which may be the exciting cause of the hydrocele.—*St. Thomas's Hospital Reports*, Vol. VII., 1876.

ARTERITIS IN THE COURSE OF TYPHOID FEVER.—An account was given on page 248 of the current volume of the RECORD, of the cases reported by M. Lerebouillet, in which typhoid fever was complicated by gangrene of the feet caused by the formation of clots in the abdominal aorta and iliac arteries. M. Potain now reports two cases of typhoid fever occurring at the Hospital Necker, in which convalescence was complicated by arteritis, which, however, ran its course without the formation of clots. Both subjects were young men, one of eighteen, the other of twenty-two years of age, and in both the symptoms were very similar. These were, pain along the course of femoral vessels, diminution in pulsation of arteries, increase of the circumference of the affected limb, without however any œdema, and an absence of any cord-like induration of the vessels. In one of the cases the temperature of the affected limb was appreciably raised above that of its fellow. Both cases did well, the affection lasting but a few days, when it disappeared without leaving any traces of its presence. M. Potain considers that these prove that arteritis in the course of typhoid fever does not necessarily lead to gangrene, and considers it a primary affection, and not consecutive to an embolus.—*Le Mouvement Médical*, Feb. 23, 1878.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, April 20, 1878.

OUR RELATIONS TO OUR FEMALE PATIENTS.

A FEW days since a young physician in this city, and one of the staff of the North-Eastern Dispensary, was charged by a female patient of that institution with the commission of the crime of rape. When the announcement to that effect was made in the daily papers, those gentlemen who were personally acquainted with Dr. Oppenheimer, and the profession generally, of which he is a reputable member, did not, of course, believe that there was any foundation for it in fact. We are happy to say that a thorough examination of the case has justified such an impression. Perhaps the best way to prove this is a statement of the facts somewhat in detail.

The girl, eighteen years of age, entered the 57th Street Court-room and charged that on Thursday, March 28th, between 3 and 3.30 o'clock P.M., she entered the Dispensary and proceeded to Room 3 to have her toe dressed, the surgeon, Dr. Davis, being alone with her in the room. While there, she further stated, Dr. Oppenheimer, a physician of the Dispensary, entered, and Dr. Davis, after some sign to him, left the room for the purpose of allowing him the opportunity of making an indecent assault. The latter, she alleged, was accomplished when Dr. Davis returned, and she went home.

Judge Otterbourg, observing the girl's actions in the court-room at the time of making the charge, and doubting the possibility of an indecent outrage in a crowded dispensary, together with the fact that two respectable physicians were charged with complicity in the act, refused to grant a warrant of arrest, but privately invited both gentlemen to his room to explain the matter.

On Thursday, April 3d, at 4 o'clock, in the judge's private room, the girl, accompanied by her guardian, repeated her story, contradicting herself, however, on some points, in the presence of the judge and the physicians of the Dispensary. Dr. Oppenheimer stated in his defence that on the day alleged he entered the Dispensary at 2.20 P.M., went to his room, saw his patients, called on Dr. Tansley, whose room adjoins his, and left the Dispensary at 2.50 P.M., his departure being noted by Dr. Tansley and Dr. Gunning, the Assistant House-Physician. He also affirmed that at no time on that day was he in Dr. Davis's room, the place of the alleged assault, and that he did not remember ever having seen the girl before, except once, about a week previous to the alleged assault, when on entering the surgeon's room, to borrow a spirit lamp, he saw Drs. Davis and Gunning dress her toe, and remarked that he believed he had seen her toe-nail removed a year ago by Dr. D.; and that having obtained the lamp he left the room.

Dr. Davis stated that on the day of the alleged assault Dr. O. had not been in his room, nor had he seen him anywhere else in the Dispensary; that Drs. Maguire and Gunning were in the room with him while attending the girl, and that afterwards she immediately left the room and the Dispensary; that he did not leave the Dispensary until about 5 o'clock, and that no such assault could have taken place without a dozen physicians and forty to fifty patients becoming aware of it, as the rooms are separated by mere boards with large intervening cracks, so that the slightest noise in one room would call the attention of all the inmates of the institution.

Dr. Gunning stated that he saw Dr. O. leave the Dispensary at 2.50 P.M., long before the girl entered, and that as Assistant House-Physician, he called the doctor's attention to his early departure, and that Dr. O. had answered he was busy and wanted to get home early. He was also positive that the girl entered after the doctor had left the Dispensary, it being his duty to mark the card of admission of all patients on entering the room. That he went to the surgeon's room, where he saw Drs. Davis and Maguire, that the girl entered, and during her presence and after her departure he remained in the room, discussing with the doctors a medical topic.

Dr. Maguire stated he was in Room 3 before the patient entered, and remained in the room with Drs. Gunning and Davis long after she had left the Dispensary, and that Dr. O. had not been in the room all day. He further stated that he knew the girl, and did not believe her to be in a sound mental condition, as he had previously treated her for hysterical convulsions, after which she had stated she was going to heaven, etc. This fact the guardian admitted; and he, with his wife, acknowledged before the examination that the girl was not of sound mind. The girl, while waiting in the examination-room, was constantly smiling and smirking at reporters, doctors, and even at the judge himself, and this was also noticed. She contradicted a portion of her previous statement, and during the examination was seized with an hysterical convulsion.

The judge was satisfied that the whole story was a delusion on the part of the patient, and the girl not competent, on account of her impaired mental condition, to make a complaint. To vindicate the doctors, he advised a commission of medical men to examine her mental condition, and for that purpose Profs. Hammond, Meredith Clymer, Jacobi, Lusk, and Dr. Dawson were appointed. On the Saturday following, at her residence, these gentlemen examined the girl, and found that she was an old epileptic, of unsound mind, and, moreover, that she was then suffering from a severe attack of specific gonorrhœa. They gave it as their opinion on summing up that the whole story was a delusion on the girl's part, as there was no physical or moral possibility of such an assault taking place as she described. Thereupon the guardian withdrew the charge, promising to send the girl to an asylum.

Although this is as full a vindication as one might desire, the physician has, nevertheless, been placed in a very unpleasant position before the public. In this, as in all similar cases, prevention of the charge would have been so much better than the most satisfactory explanation afterwards, that we are tempted to make one or two suggestions bearing upon that point. It is universally conceded that physicians are particularly liable to charges similar to those made against Dr. Oppenheimer. Considering the opportunities which are offered to disreputable persons for so doing, it is a matter of some surprise that we do not hear of more such cases. It is certain, however, that we cannot prevent such charges being made, but for individual protection we have a right to protest against their publicity until all the facts can be thoroughly investigated. The latter was the intention of Justice Otterbourg, but, in consequence of stupidity on the part of an officer of the court, the charge found its way upon the blotter in the police-station, and was then the legitimate prey of the sensational newsmonger.

It is a fortunate circumstance that the Dispensary was selected as the place in which the crime was said to have been perpetrated. If the private office of the physician had been named it would have been more difficult to have disproved the charge, and in the mind of the public there might have been much room for doubt as to the completeness of the vindication. Although in the present case the charge was absurd, and was to the last degree such as might have been anticipated from a weak-minded, hysterical female, it does not follow that similar ones may not be made, founded on more reasonable grounds. At all events, while glad of the opportunity for vindicating the medical gentleman who has suffered so much from the public notoriety of this case, we can seize an opportunity, which a general view of it affords, for urging the exercise of the greatest care in the treatment of such cases, and for guarding as much as possible against all suspicion of unprofessional conduct.

It is well understood that there is always more or less danger of malicious prosecution in treating some females without the presence of a third person, but physicians are very apt to forget this. Especially is there danger when vaginal examinations are necessary, or when anæsthetics are to be administered, and when, during any part of the operation, the surgeon may be alone with the patient. The general rule then is a good one—for every practitioner to be on his guard against such occurrences. With gentlemen in large gynecological practice it is the custom to keep female nurses in attendance, and to send them to the houses of the patients in advance of the visit at which a vaginal examination is to be made, or a gynecological operation is to be performed. Although this is not necessary with ordinary practitioners, and in fact cannot be expected of them, still it is always wise to follow such an example, as near as circumstances will admit.

Fortunately for the profession of medicine the public at large are not willing to credit any scandal of the sort to which we refer. Medicine has earned for itself a general reputation for honorable conduct which long antedates the Hippocratic oath, and which, from time immemorial, has entitled the medical adviser to be admitted into the most sacred confidences of the family circle. Hence, as an offset to any dangers which may beset our reputations as honorable men, we can enjoy the proud satisfaction of knowing that the public at large is prejudiced in our favor, and that the burden of proof of guilt must necessarily rest upon our accusers.

OUT-PATIENT DEPARTMENT OF THE NEW YORK HOSPITAL.

THE next meeting of the Medical Society of the County of New York will be held Monday evening, April 22d, when it is to be hoped a report will be made on the Out-Patient Department of the New York Hospital by the Committee appointed for the purpose. There is but one way to view the matter as regards the board of managers, and that is in the light of a gross abuse of medical charity. As we have said on a previous occasion, the profession asks for very little in the way of a reform, and that is a discrimination simply between those patients who can only pay the very small monthly fee and those who are well-to-do, but who are openly encouraged by the present regulations to cheat the poor and struggling practitioner out of his just dues. We have been informed that twelve hundred dollars were collected by these small fees during the first year, and that a motion to divide the sum among the medical staff was lost. This is doing very well for a beginning, and quite conclusively shows what kind of an African there is in the fence. But we do not care to anticipate any of the facts which may quite naturally find their way into the report. We hope, however, that the latter will be made

directly to the Society for some expression of opinion on the part of the members before it is referred to the Comitia.

BLACKMAILING OF SURGEONS AND MALPRACTICE SUITS.

It appears, from a closely printed pamphlet of twenty pages just issued by Eugene F. Sanger, M.D., of Bangor, that the statute law of the State of Maine, as concerns prosecutions for malpractice, might be modified with material advantage both to the medical profession and to the public. A suit tried at the January term, 1878, of the Superior Court in Penobscot County, was based, according to defendant, Dr. Sanger, upon the following facts: One Bowley, of the town of Alton, the plaintiff in the case, had manifested latent symptoms of disease of the bones and articular structure of the right knee-joint for twelve years, when, in April, 1876, he received a blow on the internal aspect of the leg just below that joint, causing an abscess in the fleshy tissues just beneath the contusion, and rekindling a tendency to the joint-disease commonly styled white swelling. He had been treated by Drs. Folsom and Perley, of Oldtown, and by Dr. Seavey, of Bangor, who had twice aspirated the abscess, and finally lanced it in August, 1876, over the knee-joint. He had been lame ever since, the abscess having gradually extended itself after the last operation, until on the night of August 10th (the ninth day of the lancing) he sent for Dr. Sanger, who saw him the next day. The swelling had rapidly increased down the leg; the skin was red, infiltrated, baggy, and threatened mortification from the burrowing and detention of acrid matter, decomposed by exposure to the air through the opening. Calling to his assistance the late Dr. Weston, who, previous to his demise, made affidavit to the facts detailed by the defendant, Dr. Sanger examined the joint, Bowley stating that Dr. Seavey had let out the joint-water by careless lancing, and probably ruined his leg. Having passed a grooved director into the wound and explored it cautiously in various directions, they concluded to enlarge the opening, in order to give free vent to the purulent matter burrowing within and gradually diseasing the subjacent tissues; and ether having been administered by Dr. Weston, Dr. Sanger reintroduced the director, with the groove looking towards the surface, ran a knife along the groove so as not to injure the underlying structures, and made a bifurcated incision about three inches in length, with the opening of the fork at the bottom. A cotton tent, to absorb the acrid matter, was introduced into an opening admitting the little finger, which ran backward from the bottom of the abscess towards the calf of the leg. Drs. Folsom and Briggs both testified to having treated the patient's knee, the former for several seasons previous to 1876, and the latter in conjunction with Dr. Seavey; and Bowley was especially notified by Dr. Sanger, on the morning of August 12th, that stiffness of the joint and the existing disease were events for which he would not be responsible. Bowley remained under Sanger's care twelve days, improved rapidly, and was able to be down-stairs and out of doors within a week after the operation. On August 23d, the patient went to Orono, with the understanding that he was to return in a few days for a more thorough examination of the diseased joint, making it a crucial test that if the abscess did not fill in and heal rapidly, it would confirm the suspicion of established bone-disease, in the event of which surgical interference would be necessary to save the motion of the joint and the limb from amputation. On the following day, August 24th, he sent a postal card to Dr. Sanger: "Need not look for me; two or three doctors say you have injured me; I have two good doctors for my evidence; you must settle all damage."

At Orono, Bowley boarded with Mrs. Deane, who testified to his having placed himself under the joint care of Drs. Fisher and Seavey, to whom he told the story that Drs. Sanger and Weston had cut out a large piece of sound flesh and punctured the capsular ligament, letting out the "joint-water," exposing the knee-joint to the air, injuring the delicate structures of the joint, etc. The case turned upon the evidence of an ignorant Irishman, who deposed that he was present at the operation performed by Dr. Sanger, but of whom Dr. Weston's ante-mortem affidavit stated that he was in and out on that occasion, and not in a position competent for exact observation, even were a hack-driver, such as Finnegan was, competent of intelligent observation under the best of circumstances.

Of course the suit came to naught, as any prosecution so obviously without competent basis properly should. But its initiation serves, under the circumstances, to point a moral that should not be forgotten; and that is, that in some parts of this country the position of the surgeon before the law is a standing invitation to irresponsible parties to engage in vexatious prosecutions, at the instigation of rival practitioners, of a clever and unscrupulous lawyer, or even of personal gain. Whether he defends successfully or not, the reputation of having been prosecuted for malpractice is not a desirable one, and no triumphant vindication can fully resolve the doubt thus cast upon his judgment and ability in his profession; and, if successful, he has to defray the expenses of a defence which has barely served to avert a bill of damages, but cannot reinstate him in his former undoubted professional position. As Dr. Sanger very truthfully observes, wealthy surgeons far prefer, even when they might defend with success, to submit to blackmail and exactions of a pecuniary nature, rather than to accept the unpleasant notoriety of a legal issue in their favor. We believe, however, that this is a mistaken policy, and has a tendency to propagate an evil which in the end reacts with terrible force upon the poorer surgeon who manfully stands up for his rights before the law.

There appear to be two laws respecting malpractice suits in operation in this country. Under the one, the patient has practically nothing to hinder him from starting a malpractice prosecution upon mere speculation or malice. He has only to make a case, and the State takes the responsibility. Under the second, the prosecuting party has to give bonds to pay the taxable costs of the suit, provided it issues against him. In cases of flagrant malpractice, public sentiment is not long, as every careful observer is well aware, in providing the injured party with the means of bringing the action; there are too many lawyers who want business, for an eligible suit against a medical man of property to lie neglected. It should be remembered, also, that there is a class in every community who, though able to pay, never settle their physician's bill without dispute and ill-feeling, and are only too glad to promote prosecutions as a means of gratifying their malice. Taken all in all, it would seem, therefore, that the safeguards against malpractice are sufficient, when its most flagrant aspects are made criminally punishable and the injured party has his undoubted remedy in a bill of damages, without encouraging such suits by a law that allows a pauper to set on foot a causeless prosecution, and, when it collapses, to leave the State and the successful defendant to pay the costs. The surgeon, it must be recollected, makes no pretensions to infallibility. The fact that he has had a special training as an operator enables him to undertake a work with less danger of blunder than a layman, and he is trusted because of his trained judgment and experience. Doing his best, guilty of no intentional blundering, his failures are landmarks of experience for others, although perhaps reacting unfavorably against his own reputation. The common law requires simply the exercise of all the skill he may possess, and when this condition is fulfilled he is not accountable for disastrous results.

Reports of Societies.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.

Stated Meeting, March 25, 1878.

DR. J. C. PETERS, PRESIDENT, IN THE CHAIR.

THE MECHANICAL TREATMENT OF BOW-LEGS FROM RICKETS.

DR. E. F. HORST read a paper which was devoted to answering the question: "Is mechanical apparatus necessary in the treatment of bow-legs due to rickets?" In the first place he gave a review of the opinions of those who favored and of those who opposed mechanical treatment, and then passed to the question of etiology. Here it was also found that there was a variety of opinion among authors; some regarding it as a condition essentially scrofulous, others that it was in no way associated with scrofula, and again there were those who believed that it was intimately related to syphilis, while others claimed that bow-legs had no such relation.

The history of a few cases was related which seemed to show that rickets was a disease which might depend upon *diathetic* and *hereditary* influences. The doctor did not wish to assert that struma and heredity were causes of rickets, but it had seemed that children born of strumous parents were especially predisposed to the disease.

With reference to the tendency of bow-legs to recover spontaneously, Dr. Horst thought it could be safely inferred that no such tendency was manifested in the cases which had fallen under his observation. On the other hand, it was not claimed that in all cases the condition would be benefited by the use of mechanical apparatus. An objection had been raised to mechanical apparatus because atrophy of the muscles was apt to follow its use. To a certain extent the objection was good, because the apparatus pressed upon muscles, and, until the child became accustomed to its constraint, it would not run about much; but after a little time the apparatus was worn without difficulty. What atrophy did occur, affected only the muscles pressed upon. It might be supposed that constant pressure would induce paresis of the muscles, but such did not seem to be the case. Forty cases had been examined with reference to that point, and in none was muscular contractility diminished.

Dr. Horst then proceeded to analyze sixty cases which he had had under observation at the Hospital for Ruptured and Crippled; fourteen in which no mechanical treatment had been used; and forty-six which were treated by means of mechanical apparatus.

The conclusions reached were that, in bow-legged children over three years of age, not much improvement attended the use of mechanical apparatus. In none of the forty-six cases was there any increase of the deformity while wearing the apparatus, and in that way it prevented the great curvature. Improvement occurred in all except eight cases. It was as follows: in eight no improvement; in fourteen slight improvement; in eleven fair improvement; in ten great improvement; and three cases were regarded as cured. In one-half of the cases mechanical treatment afforded considerable relief.

It was thought that the use of mechanical without constitutional treatment was not advisable. In the Institution, however, preparations of lime had been abandoned, chiefly on account of their expensiveness. Cod-liver and iron were beneficial as tonics.

The paper was accepted by the Society, and being open for discussion,

DR. LEWIS A. SAYRE remarked that it was plain, practical, common-sense to give the limbs of rachitic children mechanical support until the bones of the legs could, without bending, bear the entire weight of the body. He regarded cod-liver oil and preparations of lime as very essential in the treatment of these cases, for it was the absence of the salts of lime in the bones that made them yield under the weight of the body. It was, therefore, very poor economy to deny the children that which was necessary to give their limbs proper strength. No child was fit to stand whose bones could be sprung out of shape; but if permitted to assume the erect posture the limbs should receive mechanical support.

DR. J. LEWIS SMITH remarked that he had had but little experience in the use of mechanical apparatus in the treatment of bow-legs, but that he had used constitutional remedies in quite a large number of cases. By the early recognition of rachitis he had insisted upon keeping the child quiet, and then had

given medicinal remedies, together with the use of such hygienic measures as were necessary, until the limbs could support the body. The remedies which he had found most serviceable were cod-liver oil combined with the lacto-phosphate-of-lime, and the syrup of the iodide of iron.

Dr. Smith did not fully accept the theory that rachitis was always due to the presence of an excess of lactic acid, although an excess of that acid might prevent the deposit of the salt-of-lime, which was one of the best known features of the disease. He was of the opinion that the disease might exist as a congenital affection. He had seen one case of bow-legs without rachitis.

Dr. D. W. Yandell, of Louisville, remarked that rachitis was rarely seen in Kentucky, but he was not of the opinion, however, that its absence was due to the fact that the water of that region contained a large proportion of lime. The young negro children were very commonly rachitic, but as soon as they were able to run about and get a better supply of food than that obtained from the mother, their limbs began to straighten and they grew up well-formed men and women. It was formerly supposed that the formation of urinary calculi was favored by their limy soil, but in Western Tennessee there was plenty of calculous disease, and yet the soil contained scarcely any lime. He would not like to say that rachitis was due to the absence of lime in the system, or to the presence of an excess of lactic acid, but preferred to regard it as the result of faulty nutrition dependent upon the absence of proper hygienic influences and the use of improper food. Dr. Yandell drew attention to the fact that rachitis occurred among the calves in England and in Texas, and also had been frequently seen in dogs.

The Society then adjourned.

Correspondence.

THE TREATMENT OF ABORTION.

To the Editor of The Medical Record.

Sir:—I trust you will allow me, in connection with a recent case, and even at this comparatively late date, to call attention to an article in the Record for Dec. 29, 1877, page 817, entitled: "Abortion, its Symptoms and Treatment. Being the Substance of Four Lectures delivered before the Medical Class of the University of Pennsylvania, by R. A. Penrose, M.D."

The treatment is divided into two heads—the preventive and curative. Under the latter division the following language is used: "If abortion occur during the second or third month, strive to secure a complete evacuation of the uterus. Otherwise the placenta will remain behind, and, becoming detached in the course of a day or so, will give rise to very serious hemorrhage . . . . . When the child has been expelled, introduce your finger into the cavity of the uterus, and feel for the after-birth. If it remains in the cavity, it must be removed at all hazards. Have the woman brought to the edge of the bed, place one hand upon the abdomen, and insert a finger of the other hand into the uterus. Press the uterus well down upon your finger inserted into it, and scrape away until you have removed all the after-birth. Never leave this work to nature, but see to it yourself at once. When the placenta and membranes cannot be removed by the finger, various instruments have been devised for seizing them and bringing them out. . . . . The only instrument that has proved efficient is this species of duck-bill forceps which I now show you. I defy anything to get away which has once been caught by this instrument."

It may seem presumptuous for a "country practitioner" to take exceptions to any of the above language of the distinguished professor, but I beg leave to enter a protest to the radical method suggested. It is not only unnecessary but extremely hazardous, not to say extremely difficult often, to "press the uterus well down upon the finger inserted into it, and scrape away until you have removed the after-birth." In most instances in which we are called to these cases of early abortion we find the hemorrhage excessive, the bedding saturated, the patient exsanguinated, pale and faint, and filled with apprehension. We all know that entire safety is only secured by emptying the uterine cavity of fœtus and placenta, and in our zeal to secure this end we may sometimes be tempted to resort to the methods suggested by the professor, duck-bill forceps and all. If successful, and we can present to the patient and friends at once the little "embryonic man," and the fresh little placenta fished from a mass of clots, it pleases all concerned; and we may leave the premises with a comfortable fee, and the blessings of the patient. The writer has followed that teaching and mode of procedure too often in the past, and failed so signally many times, that he long since abandoned it and pursues a more conservative and therefore "a more excellent way."

Taking for granted that the fœtus has been expelled, and we have to deal with a retained placenta attended with hemorrhage more or less severe, the tampon—made of strips of "old muslin," eight or ten inches square—is resorted to, the vagina being packed from its vault to the vulvæ, and secured by a T-bandage. This soon absorbs the blood in the vagina, and, if well applied, is an absolute protection against further dangerous bleeding. The further loss of a few ounces of blood in many of these cases might prove dangerous, if not fatal.

In about twelve hours the tampon is removed, and usually the placenta will be found attached to the first cloths inserted. If not, the vagina is syringed with carbolized warm water and the tampon is removed, using, of course, fresh cloths lubricated with olive oil or castile soap and warm water. After remaining twelve hours longer the cloths are removed, and I have always found the placenta in the upper vagina ready to be brought away with the tampon. I never have found it necessary to repeat the tampon the third time. Its presence softens the os, excites moderate, almost unconscious, uterine contraction, and enables the physician to leave his patient for other duties, confident in the perfect immunity from danger in which he leaves the valuable life entrusted to him.

I may be better understood by reporting in this connection the following typical case which has just occurred in my practice. I treat a goodly number in the same way every year and with equal success.

Mrs. A. B., aged thirty-two, American, in good circumstances, married eight years, has borne four children at full term, and, with this, has suffered four miscarriages. Was called to this lady at 10 A.M., March 24th, ultimo. She informed me that she thought she was nearly four months on in pregnancy. For a week she had daily noticed a slight vaginal discharge of blood. Her children had the whooping-cough, and she had been broken of her rest a great deal in caring for them. She had that morning been about as well

as usual attending to household cares, and while standing at a table she felt a sudden escape of blood from the vagina, and went immediately to bed. She fainted quite away before my arrival. I found her pale and prostrate, with feeble, rapid pulse. A large amount of blood saturated the bed. Included in these clots was a small fœtus about three inches in length. The vagina was filled with clots, and blood escaped freely from the uterus. This slight examination induced extreme syncope. I at once "plugged" the vagina, as above detailed. Squibb's f. ext. of ergot was given, which excited vomiting; but this effort acted favorably by forcing blood to the brain. I remained with my patient three hours, using restoratives vigorously, and striving to relieve the deadly nausea and depression. Our efforts were successful, and a good degree of reaction secured. At my evening visit I found no hemorrhage had occurred, and the patient so comfortable that it was decided to leave the tampon *in situ* until morning.

At 6 30 A.M., on the 25th, the cloths were, one after another, removed, saturated with dark blood, and the entire placenta was found in the vagina attached to the upper cloths. The uterus was found well contracted and closed. My patient is making a rapid recovery.

Had I at my first visit persisted in getting away the placenta "at all hazards," by the method suggested by Prof. Penrose, I feel almost sure that a valuable mother and lovely woman would have been lost to her young children and numerous friends.

Very respectfully,

H. C. MAY, M.D.

CORNING, N. Y.

SUCCESSFUL TREATMENT OF A CASE OF ANEURISM BY THE USE OF THE ESMARCH BANDAGE.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—In July last Mr. R., No. — Lexington St., Baltimore, called at my office to consult me in relation to a tumor on his right leg. He stated that he had been under treatment for two or three months, and had applied the usual remedies—iodine and other absorbents—but without any perceptible effect. The patient's age was 63; profession, a milliner; temperament lymphatic; nervous system well developed; heart's action full and regular; chest well developed; inspiration and expiration normal; digestive organs in good condition; muscular system relaxed. The only evidence of disease was the tumor, the size of an English walnut, and the shape of an almond, located in the region of the posterior tibial artery, in the lower third. The parts below were œdematous, but whether from the pressure of the tumor on the artery, or the obstruction of the circulation through the artery, I was unable to determine, as the tumor, owing to the thickening of its walls, betrayed no pulsation.

I then explored it with a tenotomy knife, and the resultant intermittent flow and brightly colored blood showed at once that the artery itself was involved, and the tumor necessarily an aneurismal one. Ordinarily the method of procedure would now have been to ligate the artery, but, as I did not like the appearance of the foot, owing to the extent of the effusion, I decided to apply the Esmarch bandage, beginning with the foot and carrying it above the tumor. I did so, and after the lapse of five or ten minutes removed it and followed it with a roller-bandage, making a compress immediately over the tumor (which, under the pressure of the Esmarch, had entirely collapsed and refilled slowly) with tin-foil. In this condition I left it until the following day, when I found that the foot was still œdematous, though to a less degree than before. The symptoms being favorable, and the patient professing much relief from the application, I determined to reapply the Esmarch and continue the same line of treatment.

On my next examination, three days later, I found a further very decided improvement in the patient's condition. The walls of the tumor had become consolidated, and the collateral circulation established. I now felt certain of the wisdom of the treatment, and for a third and last time applied the Esmarch. Readjusting the roller-bandage every three or four days, I found at the end of the second week that the œdema had entirely passed away, and in five weeks from the date of the first application the patient was able to attend to his business as usual.

W. H. CRIM, M.D.

185 W. FAYETTE ST., BALTIMORE.

ALCOHOL FOR ANTISEPTIC SPRAY, AND COTTON-WOOL AS A SURGICAL DRESSING.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—I report this case for the purpose of directing attention to a simple antiseptic plan of treating wounds, and to illustrate some points in the pathology of cancer.

Mrs. P., aged forty-one; brunette; slight form; general health not good; father and his brother died of cancer; mother's father died of cancer. Patient discovered a tumor in the left breast, Feb. 16, 1878, the size of a hickory-nut. I examined it on the 23d and 27th, and found by touch a rapidly growing tumor, deeply imbedded in the gland, with no adhesions. No lymphatic glands affected. I advised immediate removal. There had been only slight pain. I excised the breast on the 2d of March, just two weeks after the patient's discovery of the tumor, which, it will be remarked, is an unusually prompt resort to surgical aid. The tumor had then attained the size of a hen's egg. The patient was etherized. The antiseptic consisted of a twenty per cent. solution of commercial alcohol, perfumed. It will be found that bacteria cannot live in a thirteen and a half per cent. solution of this description. No spray was used, because every part of the exposed surface could be readily reached by sponging. Before and during the operation the region of the wound, and *everything* that came in contact with it, was frequently and freely disinfected. No portion of the gland was wounded, but it was removed intact by enucleation as much as possible. One artery only required securing, which was the long thoracic. Less than one ounce of blood was lost. Much of the contiguous tissue was then removed, after which specimens of the remaining tissue, nearest the site of the tumor, were examined under a microscope with 300 diameters, and no cancer cells discovered. The wound was now closed by interrupted sutures of white horse-hair. These sutures I have used for some years, because they are non-irritating, and need not be removed until the wound is healed. This is a valuable desideratum in antiseptic surgery. No straps were used. The wound was next covered with very light gauze, and then cotton-wool. The gauze was used to prevent the cotton being car-

ried between the edges of the approximated integument. The use of cotton-wool as a dressing for wounds is, in my opinion, one of the most valuable improvements of modern times. My experience in its use extends over a period of five years, and I am entirely satisfied that the result fully supports the theory of its power to arrest the progress of putrefactive germs. This property is not enhanced by medication, because it is perfect without. Over the cotton-wool compress, and around the body was placed a snugly drawn bandage. The cotton-wool thus protected the wound against bacterian germs, was ready to absorb exuding fluids, and furnished an elastic support to the injured tissue. The value of the latter property cannot be overestimated. The dressing becoming somewhat stained with blood, was changed on the third day, it being detached from the wound by the free use of the antiseptic before mentioned. Subsequent changes in the dressing were only made for the purpose of noting the condition of the wound and surroundings. A small abscess formed just above the outer angle of the wound, and opened into it. This caused the patient and your reporter some uneasiness until its true character was determined. *Not one drop of pus formed upon the incised surface.* Only two doses of opiates were necessary to afford relief from pain. I removed the sutures March 21st, the wound being healed. The physical properties of the horse-hair had in nowise changed, and the wound of the small Glover's needle had not become enlarged. The cicatrix will be protected from irritation or injury by being covered with a soft pad, with rubber dam next to the flesh. If irritation is the exciting cause of cancer, it will be observed that, in this case, the prospect of a recurrence has been reduced to a minimum.

This description applies to many another wound I have treated in the same manner, with the exception of the kind of antiseptic used. My patient, then, had not to recover from the depression of chloroform; had not to be offended by the diabolical odor of carbolic acid; had none of the stench to endure that results from decomposition in wounds, and had simply to be let alone by the nurses.

The principle of the antiseptic treatment of wounds consists in the prevention of the ingress of putrefactive germs to the exposed surface, from the beginning of the operation to the permanent closure. The plan I have described for the accomplishment of this object is a simple one, is equal in efficiency to any, and can be easily applied in all cases. I have seen wounds fail to do well under cotton-wool, but never if first thoroughly disinfected.

An examination of the removed portions showed an elastic but firm tumor, cutting like the traditional raw turnip. To the unaided eye it appeared to blend perfectly, at its surface, with the gland, but its borders were more distinct under the scalpel. Its growth was interstitial as to the gland, and not by displacement, as is that of benign tumors. It proved to be a cystic fibroma, containing a starchy appearing fluid. The anterior wall was several times thicker than the posterior. The fluid was rich in round cancer cells, and had the same microscopical appearance of the "cancer juice" obtained from the walls of the tumor. These characteristic cells were as numerous in the gland at the distance of half an inch from the tumor as in the tumor itself. They gradually decreased in numbers from this point towards the circumference of the gland, until, in the extreme border, they were found to be quite isolated. No cells were found in the adipose or other tissue outside of the gland.

Many deductions of a practical character, referring to diagnosis, prognosis, pathology, and treatment, may be founded upon the history of, and the pathological conditions developed in this case. That to the intelligent professional reader they require no summarizing, is my belief, and therefore my reason for not further encroaching upon your space.

DEWITT C. WADE, M.D.
HOLLY, MICHIGAN.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from April 7 to April 13, 1878.

MIDDLETON, P., Capt. and Asst. Surgeon. Relieved from duty in Dept. of Texas, ordered before the Army Medical Board, New York City, for examination for promotion, and after examination to report by letter to the Surgeon-General. S. O. 72, A. G. O., April 6, 1878.

JESSOP, S. S., Capt. and Asst. Surgeon. Granted leave of absence for one month from June 1, 1878, and his resignation accepted to take effect June 30, 1878. S. O. 74, A. G. O., April 9, 1878.

POPE, B. F., Capt. and Asst. Surgeon. Relieved from duty in Dept. of Texas, ordered before the Army Medical Board, New York City, for examination for promotion, and after examination to report by letter to the Surgeon-General. S. O. 72, C. S., A. G. O.

CORSON, J. K., Capt. and Asst. Surgeon. Granted leave of absence for one month. S. O. 63, Dept. of the East, April 8, 1878.

HAVARD, V., 1st Lieut. and Asst. Surgeon. Granted leave of absence for six months, with permission to go beyond sea. S. O. 71, A. G. O., April 5, 1878.

ORIGIN OF BACTERIA IN FEVERS.—The *Gazette des Hôpitaux* of the seventh ultimo gives a pretty full report of a lecture delivered before the Academy of Medicine, Paris, on the evening of the fifth, by M. Colin, Pasteur's most determined critic and opponent, who discussed with great observational and experimental detail the origin of bacterids in the so-called carbonous fevers. One of the points to which M. Colin addressed himself was, what becomes of the poison during the period of incubation? In other words, is it lodged in certain organs and tissues only, or in certain vascular tracts, or is it disseminated throughout the whole system? In the absence of facts furnished by clinical observation, M. Colin has long been engaged

in a series of experiments looking to the resolution of this doubtful issue; and, after many abortive attempts, he believes that he has settled the question, and announces the following summary of conclusions:

1. That the lymphatic glands are the organs first to acquire the virulence, and that from these centres of incubation it penetrates throughout the whole animal economy. 2. That these glands become affected successively, in the order of their situation in the lymphatic tract, and of their distances from the point of inoculation. 3. That they are transferred into centres of virulence by the regeneration or reproduction of the poison in their tissues or in the liquids impregnating them. 4. That this poisonous property of their fluids and secretions is developed for a certain appreciable period before the appearance of bacteria in the glands and vascular tract. 5. That the glands are the special receptacles and regenerating centres of the poison during its whole sojourn in the system; 6. That its activity in these organs is indicated by tumefaction, œdema, a reddish tint (*teinte rougeâtre*), and by interstitial hemorrhage,—in a word, by a specific irritation, succeeded, after an appreciable period of time, by the development of bacterial organisms.

M. Pasteur coincided with M. Colin as concerns the fact of the penetration of the lymphatics by the bacterids, as one that had been observed by most physicians who had made careful studies of the carbonous fevers. But he argued from the fact that injecting bacterids or bacterial fluids into the system produced just such local symptoms as M. Colin had described of the glands, that it must therefore be inferred that the organisms had been overlooked in M. Colin's experiments until they had multiplied in large numbers. M. Colin reaffirmed his position, however, and maintained most distinctly that such fevers were marked by two periods of virulence as respects the glandular structures and fluids; namely, first, in the order of time, a period of glandular irritation and poisoning, with which no bacterids nor germs of bacterids are associated; secondly, a period during which these organisms occur in abundance in the glandular tissues and secretions. M. Pasteur retorted that if the observations of M. Colin were well taken, that gentleman had made the grandest discovery of modern times, and had verified the spontaneous generation of bacteria—a point which he (M. Pasteur) had been seeking to determine for twenty years or more, without success. A commission, consisting of MM. Pasteur, Colin, Velpeau, and Davaine, was appointed to observe the experiments of M. Colin and to report upon them to the Academy.

Probable Cause of Cretaceous Degeneration of the Arteries.—Prof. Gubler communicates to a medical society in Paris some valuable observations as to the probable cause of cretaceous degeneration of the arteries, which he finds to be extremely common with the lower classes in France—so common that arterial atheroma is of frequent occurrence in the hospitals, in men of forty, thirty, and even twenty years of age. He regards the abuse of alcohol as one of the potential causes of this alteration in structure, but thinks its importance as such is somewhat exaggerated by the profession at large, and names the almost exclusively vegetable diet of these classes as probably the primary factor in producing the disease, which, he observes in corroboration, is very rare in persons subsisting in the main upon animal food. In further confirmation of this view, he instances the extreme of atheromatous degeneration in monasteries, and finds that monks confined to vegetable diet, frequently show great induration of the middle coat of the arteries at the early age of thirty-two.

At St. Catharine's Hospital, Brooklyn, E. D., it appears from the seventh annual report that 1,325 dispensary cases have been treated, 767 medically, and 558 surgically, against 623 admitted to the wards of the institution. The classifications of diseases evinces some points of interest as to the comparative frequency in the Eastern District, rather the uncleanliest section of Brooklyn, of maladies presenting almost a reverse of the statistics in the better quarters of the city. With but one case of gout and two of syphilis in the record of constitutional diseases, 35 cases of articular, and 3 of muscular rheumatism occur. Zymotic diseases include 12 cases of malarial cachexia, and 53 of active intermittent, balanced against 5 of typhoid, 2 of scarlet fever, and 5 of diphtheria. Of the 17 cases of disease of the circulatory system, 9 are concerned with insufficiency of the mitral valve; and in affections of the respiratory organs, pulmonary consumption has 107 cases against 41 of all other descriptions. Gastritis appropriates 20 cases out of the 47 accredited to the digestive organs, and Bright's disease 8 out of the 10 recorded as affections of the urinary organs. Noticeable at a glance, in diseases of the nervous system, is the great preponderance of cerebral apoplexy and epilepsy over all others.

A Remedy for the Eruption of Poison Oak, Ivy, and Sumach.—Dr. S. A. Brown, U.S.N., Mare Island, California, believes that he has found a specific for the eruption caused by contact with poison oak, sumach, ivy, huahoo, cashew nut, etc. He writes:—"This specific is *bromine*. I have used it with the same unvarying success in at least forty cases. The eruption never extends after the first thorough application, and it promptly begins to diminish. Within twenty-four hours, if the application be persisted in, the patient is entirely cured. There is no pain attending its use, as from that of astringents. Of course, the epidermis peels off as after other treatment.

"I use the bromine dissolved in olive oil, in cosmoline, or in glycerine. The application with glycerine is painful, and, I think, possesses no advantage to compensate for the irritation. The strength of the solution is from ten to twenty drops of bromine to the ounce of oil, used by rubbing gently on the affected part three or four times a day, and especially on going to bed at night. You wash off the oil twice a day with castile soap.

"The bromine is so volatile that the solution should be renewed within twenty-four hours of its preparation, as it will get out of a bottle, however well corked. It is best to stand the bottle on its cork end, in the intervals of application.

"I have seen no publication of this treatment, and I, therefore, send you my experience with it, hoping to attract to it some little attention, and do the good which must result from its adoption."

The Hanging of Polish Surgeons.—Dr. W. B. Neftel, of this city, and formerly a surgeon of the Russian Army, has called our attention to a denial of the report concerning the hanging of the Polish surgeons at Sophia, published in our issue of March 30th. Said report was extracted from an Austrian paper of the issue of Feb. 24th, but the contradiction in the same journal a few days afterwards escaped our notice.

Dr. Paul F. Mundé, of this city, was recently elected a Corresponding Fellow of the Edinburgh Obstetrical, and of the Philadelphia Obstetrical Societies.

TO ADVERTISERS.—Permit us to direct your attention to "THE MEDICAL RECORD." It has now been published over twelve years, and has become the most popular and most extensively read of any medical journal in America. Its circulation is widespread over the entire continent—probably there are few of the active, intelligent members of the Profession who are not among its regular readers. The value to Advertisers of this large list of subscribers has long been recognized, as practically shown by the great number of pages of advertisements, rendered necessary by the patronage of those who have found that

IT PAYS TO ADVERTISE IN THE MEDICAL RECORD.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

W. H. Schieffelin & Co.'s

SOLUBLE QUININE PILLS.

We would be glad to have *any* of our Soluble Pills subjected to intelligent test; but as the medicine most in demand in pilular form is Quinine, we particularly court a critical examination of our Quinine Pills, and desire that they be subjected to the test either of analysis or of therapeutic effect.

This scrutiny is invited with confidence, as we invariably use *bleached* Sulphate of Quinine, of the best American brands, in full and exact weights, and because we have never heard of a case where our pills failed to produce the effect which would have been obtained from an equal quantity of Sulphate of Quinine in its usual form.

In order to facilitate an analysis, we suggest the following process as simple and reliable.

Remove the coating from pills representing say 20 grains of Quinine, Separate excipient by rubbing them in a mortar with 2 ozs. water until perfectly smooth, and then dissolving by aid of a few drops of dilute Sulphuric Acid and filtering. Treat the filtrate with aqua ammoniæ in excess and filter again. Wash the precipitate left on the filter, by passing 1 oz. water through it. Dry on filter by gentle heat. Subject 10 grains of it to the

TEST FOR QUININE,

Published in the *U. S. Pharmacopœia*, as follows:

"When ten grains of the salt are agitated in a test-tube with ten minims of officinal water of Ammonia and sixty grains of Ether, and allowed to rest, the resulting liquid separates into two transparent and colorless layers, without any white or chrystalline matter at the surface of contact."

Any such matter floating there would indicate the presence of Cinchonia, Cinchonidia, or Quinidia.

We are happy to announce that the recent decline in the price of Quinine enabled us to reduce the price of the pills; as may be seen by referring to our latest Price-Lists.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process.

In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

Analyses of Sulphate of Quinine Pills.

As we have repeatedly notified the trade, our Sulphate of Quinine Pills are made of Bleached Quinine and contain the correct amount of Quiniæ Sulphas, as represented on the label.

We submit below three analyses of our Sulphate of Quinine Pills obtained at different druggists; the first was made by Mr. Chas. Rice, of New York, one of the editors of the "*New Remedies*," and chemist of Department Public Charities and Correction of New York City, who is well known both personally and by reputation by a large number of physicians and druggists throughout the country. The other two analyses are by Dr. Polenske, former assistant of Prof. Sonnenshein, of Berlin, and now our own analytical chemist.

Our "Hospital Quinine" Pills are made as set forth in our circular of March 27th, which we reprint for the information of those who may not have seen it before.

With the assurance to the trade and medical profession, that we will always manufacture our preparations, as we have in the past, in **perfect good faith**, that we will use the best materials obtainable, increasing our knowledge by every means in our power, for examining and testing all ingredients and perfecting our business, we remain,

Very respectfully, **McKESSON & ROBBINS.**

NEW YORK, APRIL 17th, 1878.

"MESSRS. McKESSON & ROBBINS,

Gentlemen:—Having been requested by you to make an assay of the alkaloids contained in your Gelatine-Coated Quinine Pills, I purchased an original vial, containing 100 2 grain pills, in the store of Mr. Theodore Cole, 409 First Avenue, New York. Each ten of these pills weigh·d very nearly 34 grains, and the weight of the single pills is very uniform, varying but slightly either way from 3.4 grains. The whole number of pills, (100,) yielded 143.385 grains of anhydrous alkaloid, which was found to be **pure, White Quinia**, free from other cinchona alkaloids. This amount of dry Quinia corresponds to 203.8 grains of **Sulphate of Quinia**, containing 8 molecules of water of crystallization ($2\,C_{20}\,H_{24}\,N_2\,O_2 \cdot H_2\,SO_4 + 8\,H_2\,O$; or to 201.7 grains of **Sulphate of Quinia**, containing 7½ molecules of water of crystallization ($2\,C_{20}\,H_{24}\,N_2\,O_2 \cdot H_2\,SO_4 + 7\frac{1}{2}\,H_2\,O$), which latter is, as near as possible, the formula of the commercial pure Sulphate of Quinia. The amount of Sulphate of Quinia contained in the 100 pills examined, is therefore a trifle **in excess** of the required quantity, (3.3 grains, or 1.7 grain, according to whatever formula may be adopted for the crystallized salt).

Respectfully, CHARLES RICE,
Chemist, Bellevue Hospital, N. Y."

NEW YORK, MARCH 30th, 1878.

"I have analyzed McKesson & Robbins' Gelatine-Coated 5 grs. Sulphate of Quinine Pills, from an original bottle of one hundred, and find that in two analyses of 10 pills each, the result in both cases was 51 grains of pure Sulphate of Quinine.

ED. POLENSKE, Ph. D."

NEW YORK, APRIL 18th, 1878.

"One hundred McKesson & Robbins' Gelatine-Coated 2 grs. Sulphate of Quinine Pills, analyzed by me to-day, contained 198 grains of Sulphate of Quinine. The Sulphate of Quinine obtained from these pills stood the Ether test, as laid down in the U. S. Ph.

ED. POLENSKE, Ph. D."

Circular of March 27th, 1878.

Since we changed, last fall, from Unbleached to Bleached Quinine in the manufacture of our Pills, we have heard from a large number of druggists and physicians stating that the therapeutical effects of the dark pills were better than the "bleached," dose for dose, where a tonic was indicated, and the antiperiodic effects of the former were as well marked. We made the change because we were disappointed in obtaining a uniform article of unbleached Quinine, were deceived in two shipments we received and the analyses of samples from the same package we submitted to different highly reputable chemists varied surprisingly, in fact, analysing Quinine *quantitively* is very difficult, as it depends very largely upon the different solubilities of the alkaloids in water, while the *qualitative* analysis is very simple and reliable.

The curative properties of the other alkaloids of Cinchona Barks have been well attested and the effect of the **combined alkaloids** has been repeatedly asserted to be greater than that of any **one alone.**

In view of these facts, we accordingly propose to offer Pills made of Hospital Quinine, which differs from that which has been known and understood as "unbleached," in the process of manufacture and in the proportion of Quinine. This Hospital Quinine will contain about 50 per cent. of Quinine Sulphate, and the balance, Cinchonidia Sulphate and traces of Quinidia Sulphate; the Cinchonia Sulphate, being less powerful than the other alkaloids is separated.

These pills on account of their lower price will relieve a difficulty, to which a large number of people living in malarious districts have been subjected—the inability to purchase Quinine Pills on account of price, especially when scarcity causes sudden and great advances, as at present—at the same time we believe that confidence may be felt in experiencing equal relief with similar doses.

We will continue, as now, to make our "Quinine Pills" of bleached Quinine, and the white color will readily identify them from our darker Hospital Quinines, which will be labelled "Hospital Quinine" The list of Hospital Quinine Pills we submit below is subject to same discount as our other pills, and will be reduced as soon as the market on Quinine will allow. We call special attention to our Pills of Cinchona Bark Alkaloids, which contain a definite quantity of each of the four alkaloids, one half grain each Sulphates Quinia, Quinidia, Cinchonia and Cinchonidia.

We annex below list of our Pills of other Cinchona Alkaloids, and remain, soliciting your correspondence and valued orders, Yours respectfully,

March 27th, 1878. McKESSON & ROBBINS.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greator NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

MEDICATED DISCS

FOR HYPODERMIC INJECTION.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally that the great demand which has arisen for their **GELATINE PREPARATIONS**, since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS**, and for **OPHTHALMIC PURPOSES**, as well as the **LAMELS FOR INTERNAL USE**, will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 NEW BOND STREET, LONDON, ENGLAND.

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. MEDICAL BOOKS.

When you want any Medical Books, or any information concerning them, write to

WM. WOOD & CO., Publishers and Dealers in Medical Books,

27 Great Jones Street, New York.

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

Fig. 68.

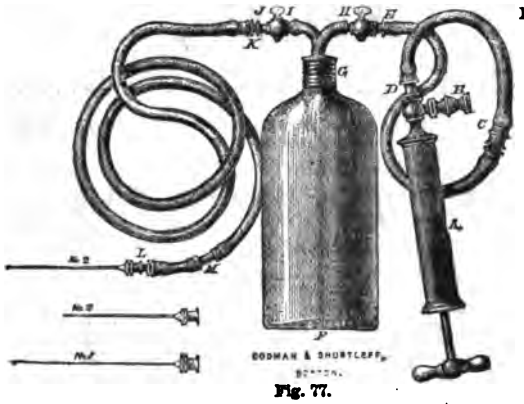

Fig. 77.

Fig. 78.

The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold-plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions..... $18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case..... $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional. 6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of. 3 40

☞ *Full description on application.*

An Illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

CODMAN & SHURTLEFF,

Makers of Surgical Instruments,

13 and 15 Tremont Street, Boston.

N.B.—See our other Advertisement in alternate numbers of the RECORD.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

In corresponding with Advertisers please mention **The Medical Record.**

DENNISON'S ABSORBENT COTTON.

[From DR. J. G. WARREN, Editor Boston Med. & Surg. Journal.]

"Among the numerous preparations which, in the shape of material for surgical dressings, have been placed in the market of late years, we have seen no such neatly prepared article as Dennison's Absorbent Cotton. It is simply perfectly pure cotton, having been carefully and thoroughly cleansed from oil, resin, and all extraneous matter. When placed in water it sinks rapidly to the bottom of the vessel, and when applied to a wound it quickly absorbs all discharges. For dressing sinuses, as in fistula in ano, or in uterine applications or examinations, it seems to be much preferable to ordinary cotton or lint."

Sold by Dealers in Dental and Surgical Articles, and Apothecaries.

A liberal Sample Package sent by mail for 25 cents by

DENNISON & CO., Proprietors, 198 Broadway, New York.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

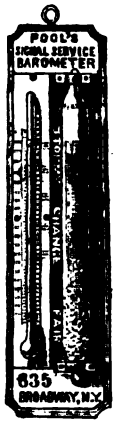
PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

What will the Weather be To-morrow?



POOL'S SIGNAL SERVICE BAROMETER,

Or Storm Glass and Thermometer Combined

WILL TELL YOU!

It will detect and indicate correctly any change in the weather 12 to 48 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators. Farmers can plan their work according to its predictions. It will save fifty times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. We will send it FREE to any address on receipt of **$3.00.** This great WEATHER INDICATOR is endorsed by the most eminent Physicians, Professors, and Scientific men of the day, to be the *BEST IN THE WORLD.*

U.S.N AGENTS WANTED **OVELTY C** CIRCULAR

BEWARE OF IMITATIONS! None genuine without our **Trade-Mark.** Every instrument warranted PERFECT AND RELIABLE. When you order, please state your Post Office address, and mention the name of Express Co., and their nearest office *to your place.* Post Office Money Orders or Registered Letters may be safely sent at OUR RISK. We make good ALL DAMAGE THAT OCCURS BY SHIPPING.

AGENTS WANTED. Send stamp for circular. Exclusive control of territory granted. Manufactured only by the

U. S. NOVELTY COMPANY,

105 Maiden Lane, New York.

LIBERAL DISCOUNT TO THE TRADE.

We clip the following indorsement from the *Cultivator and Country Gentleman*, of Albany, N. Y., May 24, 1877:

A GOOD STORM GLASS.—For the benefit of the readers of the COUNTRY GENTLEMAN, I beg to say that I fully tested, through all the storms of March, one of the U. S. Novelty Co.'s combined barometers and thermometers, and find it in all respects reliable. It tells accurately 24 hours beforehand the approach of violent storms of any kind, and is cheap at $2, and quite a little ornament.

FOOD for INFANTS and INVALIDS.

THE

Health Food Company,

74 Fourth Ave., adjoining Stewart's,

NEW YORK,

Would call the attention of the Profession to their

Cold Blast (Attrition) Whole Wheat Flour,

AS AN ADJUNCT IN THE TREATMENT OF

INDIGESTION, CONSTIPATION, and MAL-NUTRITION.

This Flour represents all the Food Elements of the Wheat, the indigestible silex coat being first taken off, and the entire kernel, including the phosphates, etc., being reduced to fine flour by a new process, in which both the admixture of detritus from mill-stones and the injurious effects of heating the flour during preparation, are entirely avoided.

IT IS CHEAPER THAN WHITE FLOUR,

Because it contains nearly four times the amount of the Mineral Substances, for

NOURISHING THE NERVES, BONES, HAIR, AND TEETH.

ATTENTION IS ALSO DIRECTED TO OUR

WHITE WHEAT GLUTEN,

For *diabetes*, and for those requiring the Nitrogenous and Mineral portions of the Wheat, *without starch*. This, like the Whole Wheat Flour, can be made into Bread and Crackers, or may be taken in various ways, and often proves a very valuable remedy for the *Constipation* and *Dyspepsia* associated with many diseases. In excessive fatness, and in disturbed mental states, the Gluten (crude and purified) proves very serviceable.

Circulars, descriptive of these and other Health Foods, mailed to all applicants.

HORLICK'S FOOD FOR INFANTS.

This article, as shown by analysis, is the only true substitute for Mother's Milk, and, unlike the other foods, **does not contain starch.** Infants cannot digest **starchy foods** until they have their teeth. This preparation also contains the **Phosphates** so essential for the production of bone and brain. It will **sustain life single-handed.** Requires no cooking.

We also Manufacture

HORLICK'S FOOD FOR DYSPEPTICS.

HORLICK'S FOOD FOR CONSUMPTIVES.

Price $1.00 per bottle. Trial size, 50 cents.

J. & W. HORLICK & CO., Chicago, Ills.

PREPARED FOOD

FOR

INFANTS AND INVALIDS.

Prepared especially to meet the requirements of the growing Infant, containing the Phosphates and all the health-giving properties of the finest wheat, many of which are altogether rejected in the usual process of preparing flour.

Also admirably adapted on account of its easy digestibility to Invalids. Price 35 cents per package.

BENJAMIN J. CREW, Pharmacist.

PHILADELPHIA.

MELLIN'S FOOD

TRADE MARK.

For Infants and Invalids,

— FOR THE —

Healthful Rearing of Hand-fed Children & the Preservation of Infant Life

AND FOR THE NOURISHMENT OF INVALIDS WHO CANNOT DIGEST ORDINARY FOOD.

Price, $1.00 per Bottle. Trial Size, 60 cents. For Sale by Druggists.

MELLIN'S FOOD IS **ENTIRELY SOLUBLE** AND **NOT FARINACEOUS.**

We will furnish a sample of Mellin's Food free to any physician who may desire to try it in his practice. Send for a pamphlet on "Infants' Food," etc., containing Analysis, Testimonials, etc.

PREPARED ONLY BY G. MELLIN, LONDON.

T. METCALF & CO., 39 Tremont St., Boston, Sole Agents for the United States.

WALTER BAKER & CO.'S CHOCOLATE AND COCOA

These Preparations have been the standard of purity and excellence for nearly one hundred years and have gained a world-wide reputation. They are pure, nutritious and healthy.

Cocoa contains as much flesh-forming matter as beef.

Broma, an excellent food for Invalids, and unrivalled in delicacy and aroma. Breakfast Cocoa,—a general favorite. Baker's No. 1 Chocolate, the very best preparation of plain Chocolate in the market. Vanilla Chocolate, unsurpassed in flavor and quality.

Awarded the highest premium at the Paris, Vienna, and Philadelphia Expositions.

BOERICKE & TAFEL'S

FRESH PLANT

Tinctures or Essences.

These are prepared exclusively from fresh plants gathered when in their full vigor, thus retaining all volatile constituents usually lost in dry ng, and uti izing all such juices, which are part y changed or rendered to a more or less degree insoluble by drying.

Medicinal plants growing in this country we gather ourselves, [whi.e of European plants we import the ready-made essences.

These plants a·e div ded into three classes, and the treatment accommodated to their greater or less degre of succulence.

Tinctures according to **Class I** are made by adding one part of the expressed juice of the plant, one part of Alcohol.

Tinctures according to **Class II** are made from three parts of the plant to two parts of Alcohol by weight.

Tinctures according to **Class III** are ma le from one part of the plant to two parts of Alcohol by weight.

To distinguish these T cinres from those of the U. S. Pharm., the Greek letter ϕ (phi) is written after their names on the label, and *appended to each bottle is a label giving the proportion of the plant in the tincture.*

These fresh plant tinctures are sold at the following rates, with few exceptions:

1 oz. 25 cts.; 2 oz. 45 cts.; 4 oz. 85 cts.; 8 oz. $1.60; 1 lb. $3.00.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 82° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	℔ per oz.

REPORT OF JUDGES.

"Novelty, great value in pharmacy, unequalled purity, and superiority of manufacture."

The attention of physicians, druggists and hospitals, is called to this article, and to the fact that it is favorably regarded and extensively used both in the United States and England, by the profession, and by pharmacists for OINTMENTS, CERATES, &c.

As a dressing for WOUNDS, CUTS, BRUISES, BURNS, SPRAINS, PILES, RHEUMATISM, SKIN DISEASES, CATARRH, SORES or ERUPTIVE DISEASES, and all contused and inflamed surfaces, it is not equalled by any known substance.

In the treatment of **COUGHS, COLDS, CROUP, DIPHTHERIA,** and of **THROAT** and **CHEST** complaints the best results are obtained.

One-pound Cans, $1.00. Five-pound Cans, $2.50.

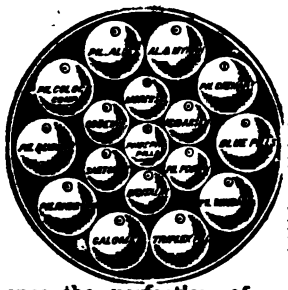
Printed Pills and Granules



These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal: Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

CONCERNING BELLADONNA PLASTER

A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

DR. J. M. GROSVENOR, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affectingthe combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty, as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U.S.P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon-like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonna Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J.M. GROSVENOR, M.D., (accompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a *cheap* product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicains, if unable to obtain Dr. Grosvenor's Improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., *22 Park Place,* **NEW YORK.** or **GROSVENOR & RICHARDS,** *97 Oliver Street,* **BOSTON.**

FLUID EXTRACT OF VISCUM ALBUM.

THE NEW SUBSTITUTE FOR ERGOT.

FLUID EXTRACT COCA.

NERVINE, STIMULANT.

USED IN PERU AND BOLIVIA AS A MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

FLUID EXTRACT OF FUCUS VESICULOSUS.

(BLADDER WRACK.)

SUCCESSFULLY USED FOR THE REDUCTION OF OBESITY.

It seems to have no appreciable effect on the general health other than the removal of the adipose tissue.

The above Extracts have been prepared by us, and special care given that their medical properties be not impaired.

GELATINE-COATED PILLS.

QUININE, CARBOLATE, 1 gr.

QUININE, SALICYLATE, 1 gr.

QUININE, SULPHATE, 1 4, 1-2, 1, 1 1-2, 2, 3, 4, & 5 grs.

QUININE, BI-SULPHATE, 1-4, 1-2, 1, 2, 3, 4, & 5 grs.

QUININE, SULPHO-CARBOLATE, 1, 2, 3, and 5 grs.

This Salt of Quinine has been very much used in some of our extreme malarial districts during the past two years. Those who have tested it very carefully, claim that it possesses a most positive specific action in the treatment of fever and ague, and has proved itself eminently superior to the Sulphate of Quinine in all malarial fevers.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
" Case of 50 Pint Jugs..... 8.00 "
Less discount according to quantity.

FOR SALE BY ALL DRUGGISTS.

P. SCHERER & CO.,

IMPORTERS OF

PULLNA and all other EUROPEAN MINERAL WATERS,

72 & 74 Park Place, New York.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 18, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynaecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT, Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	25 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1878, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 37 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1878, and continue until the last Wednesday in February, 1879. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1878, and continues 12 weeks.

FACULTY:—G. C. B. WEBBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL POMERENE, M.D.; D. B. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GENTSCH, P.C. For Circular and Catalogue, address H. W. KITCHEN, Sec'y, No. 3 Euclid Avenue, Cleveland, O.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary, BRUNSWICK, ME.

WANTED. Those of our Subscribers who have received duplicate copies of Nos. 328 & 361 of THE MEDICAL RECORD will greatly oblige the Publishers if they return them by mail to

WM. WOOD & CO., 27 Great Jones St., New York.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.
For circulars, address DEAN or REGISTRAR.

VALUABLE WORKS ON CHEMISTRY.

THE CHEMIST'S MANUAL. A Practical Treatise on Chemistry: Qualitative and Quantitive Analysis, Stoichiometry, Blow-pipe Analysis, Mineralogy, Assaying, Toxicology, etc., etc., etc. By HENRY A. MOTT, JR., E.M., Ph.D. 625 Pages. 8vo, cloth, $6.00

QUALITATIVE CHEMICAL ANALYSIS. A Guide in the Practical Study of Chemistry, and in the Work of Analysis, By S. H. DOUGLAS and ALBERT B. PRESCOTT, Professors of Chemistry in the University of Michigan. Second Edition Revised. 8vo, cloth, $3.50.

OUTLINES OF PROXIMATE ORGANIC ANALYSIS, for the Identification, Separation, and Quantitative Determination of the more commonly occurring Organic Compounds. By Prof. ALBERT B. PRESCOTT. 12mo, cloth, $1.75.

CHEMICAL EXAMINATION OF ALCOHOLIC LIQUORS. A Manual of the Constituents of the Distilled Spirits and Fermented Liquors of Commerce, and their Qualitative and Quantitative Determinations. By Prof. ALBERT B. PRESCOTT. 12mo, Cloth, $1.50.

A COMPENDIOUS MANUAL OF QUALITATIVE CHEMICAL ANALYSIS. By CHAS. W. ELIOT and FRANK H. STORER. Revised, with the co-operation of the authors, by WM. RIPLEY NICHOLS. Fifth Edition Revised. 12mo, cloth, $1.50.

MILK ANALYSIS. A Practical Treatise on the Examination of Milk and its Derivatives—Cream, Butter, and Cheese. By J. ALFRED WANKLYN, M.R.C.S. 12mo, cloth, $1.00.

LEGAL CHEMISTRY. A Guide to the Detection of Poisons, Examination of Stains, etc., etc., as applied to Chemical Jurisprudence. Translated, with additions, from the French of A. NAQUET, by J. P. BATTERSHALL, Nat. Sc. D., with a Preface by Prof. C. F. CHANDLER. 12mo, cloth, $2.00.

GUIDE TO A COURSE OF QUANTITATIVE CHEMICAL ANALYSIS, especially of Minerals and Furnace Products. Illustrated by examples. By Dr. C. F. RAMMELSBERG, translated by J. FOWLER, M.D. 8vo, cloth, $2.25.

AN INTRODUCTION TO QUALITATIVE CHEMICAL ANALYSIS. By F. BEILSTEIN. Translated from the Third Edition, by I. J. OSBUN. 12mo, cloth, 75c.

D. VAN NOSTRAND, Publisher, 23 Murray St., and 27 Warren St., New York.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving results of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

ALOE & HERNSTEIN'S
IMPROVED
PHYSICIAN'S SADDLE BAG.

This Bag is the most complete and durable Bag in the Market, and will give the best satisfaction to the Profession of any Bag ever offered. The Bag is entirely riveted with copper rivets, thereby doing away with the old style of sewing, which has been the great objection heretofore. The boxes containing the bottles are made of the best Tin Metal. A, is the metal box containing the bottles: B, is the box used to carry instruments, powders, etc.; C, is the flap, which holds the upper and lower boxes, A and B, firmly together, being fastened by a turn lock, which holds the contents in their place; D, represents the bag when closed. It is the only bag made that has a complete water-shed to prevent the contents from getting wet.

PRICES.

For Bags containing 20 Ground, Stoppered Vials $12 00

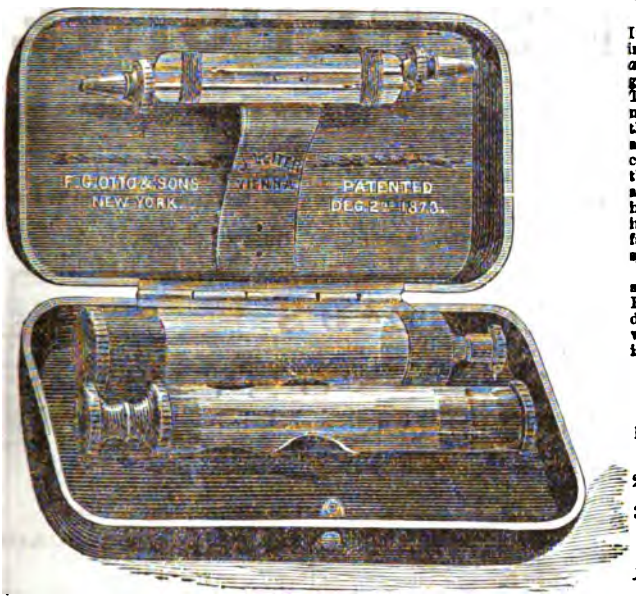
LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.



The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

NOW READY, PART III.

OF AN

ATLAS OF SKIN DISEASES

By LEWIS A. DUHRING, M.D.,

Professor of Skin Diseases in the Hospital of the University of Pennsylvania, Physician to the Dispensary for Skin Diseases, Philadelphia, author of "Diseases of the Skin," etc.

PART III. EMBRACES

ECZEMA (SQUAMOSUM).

SYPHILODERMA (ERYTHEMATOSUM).

PURPURA (SIMPLEX).

SYPHILODERMA (PAPULOSUM ET PUSTULOSUM).

"The Atlas well deserves to be known both for the wisdom of the author and for the exactness and truthfulness of the plates, which at first sight allow of the correct diagnosis of the diseases of the skin which they represent, such is the precision of the outlines and coloring. It may be maintained that this work is second to none, justly taking the lead among those which enjoy a merited fame. Every dermatologist should possess this work."—*Milan-Giornale Italiano delle Malattie Veneree e della Pelle.*

"A most beautiful and perfect work."—*American Practitioner.*

"We have no hesitation in giving this work our highest commendation. Both as a scientific treatise and a work of art, it is deserving of the greatest praise."—*Canada Lancet.*

"We accord to this work our unreserved praise, and give it our hearty commendation."—*New York Medical Record.*

The Atlas will appear in *Parts*, to be issued at intervals of four or five months each, to contain Four Plates, *Royal Quarto in size*, with text explanatory of the case represented, of the general features of the disease, of its diagnosis, and of its treatment. Price, $2.50 per Part. *The work will probably be completed within Eight, and certainly will not exceed Ten Parts.*

The edition is limited. The lithographic drawings will be destroyed after the first printing.

☞Subscriptions received by special Agents, or may be addressed direct to

THE PRIVATE INSTITUTION FOR

FEEBLE-MINDED YOUTH,

AT BARRE, MASS.,

Established June, 1848.

Offers to parents and guardians, superior facilities for the improvement of this class of persons, and the comforts of an elegant country home. A few cases of *Insanity*, of mild type, have always been received.

GEO. B. BROWN, M.D., *Superintendent.*

TO PHYSICIANS.

The attention of the Medical Profession is respectfully invited to the privileges offered *principally* to medical men, by the **HOSPITAL DEPARTMENT** of the

AMERICAN VETERINARY COLLEGE,

141 W. 54th St., bet. 6th & 7th Aves.

ANNUAL SUBSCRIPTIONS

(*Invariably in advance*), **$10.00.**

By payment of the above annual subscription, the subscriber becomes entitled to the following privileges:

First.—To have admitted in the Hospital for treatment, an unlimited number of horses or other animals, his own property, at a charge only for their keep, medicines included, $1.00.

Second.—To have the opinions of the surgeons in charge as to medical treatment of animals he may desire to retain in his own possession, without payment of fees, and to be supplied with medicines from the hospital at very low rates; but *no free visits* are expected to be made out of the Hospital.

Third.—To have horses examined for soundness, brought in the hospital free of charge.

Apply to A. LIAUTARD, M.D., V.S.,

Chief Surgeon

"CROMWELL HALL."

A PRIVATE HOSPITAL FOR THE INSANE

And NERVOUS, recently opened by W. B. HALLOCK, M.D., late First Assistant Physician of the "Connecticut Hospital for Insane."

Refers to A. M. SHEW, M.D., Supt. Conn. Hospital for Insane; SAMUEL LYNES, M.D. (Norwalk, Conn.), late Trustee of the same; J. S. BUTLER, M.D., Ex-Supt. of "The Retreat," Hartford, Conn.; ROBERT HUBBARD, M.D., Bridgeport, Conn.; Drs. E. & E. C. SEGUIN and THOS. R. POOLEY, New York; S. D. BROOKS, M.D., Springfield, Mass.), Ex-Supt. of the "New York Juvenile Asylum," and the "New York Institution for the Deaf and Dumb;" Drs. H. B. WILBUR and JOHN VAN DUYN, Syracuse, N. Y.

Application may be made to *DR. HALLOCK*, Cromwell, Conn.

PRIVATE INSTRUCTION IN

AURAL DISEASES,

At the NEW YORK EAR DISPENSARY, 400 W. 56th St., cor. 9th Ave.

By SAMUEL SIXTON, M.D.

Course, 20 Lessons. Class limited to Five. Fee, $20.00 each.
For further information, inquire at 12 West 35th Street.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.

Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings, and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases*, *Dipsomania* and *Opium Habit*, and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 158d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR. EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum. DR. WM. H. R. POST.

PRACTICAL INSTRUCTION IN

CUTANEOUS AND VENEREAL DISEASES,

AT CHARITY HOSPITAL, BLACKWELL'S ISLAND, N. Y.,

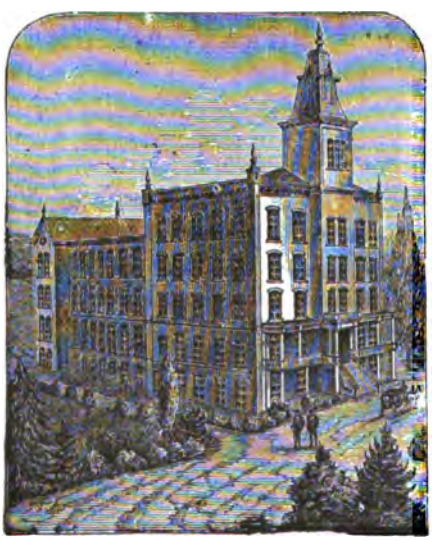
By H. G. PIFFARD, M.D.

Course, 20 Lessons. Class limited to Three. Fee, $50.00 each.
For further information, apply at 10 WEST 35TH STREET, CITY.

PHYSICIAN'S PRACTICE FOR SALE.

Physicians—rare chance—Practice of $20,000 in eight years, averaging $2,500 per annum, and splendid country home, for sale. Price, $3,200; easy terms. The property alone should bring $4,000, but wishing to retire, will sell property and practice at the very moderate sum of $3,200. Address

DR. F. W. VANDERSLOOT, Nittany, Centre Co., Pa.



THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

VACCINE VIRUS.

EASTERN DISPENSARY——VACCINE DEPARTMENT.

PURE BOVINE (ANIMAL) VIRUS.

This Virus is the result of a continued reproduction from the famed Beaugency stock, propagated under our own immediate supervision at Pearl River, N. Y. It is furnished at the following reasonable

SCALE OF PRICES:

One Quill Slip,	**$ .25**	**Fluid in Capillary Tube,**	**$1.00**
Seven Slips,	**1.00**	**Three Tubes,**	**2.00**

N.B.—Each tube will vaccinate from five to ten persons.

Concrete Vesicle—i. e., Crust or Scab, $1.00 to $3.00, according to size.

HUMANIZED VACCINE VIRUS constantly on hand, as heretofore, at same rates as above.

We guarantee success with 95 per cent. of Quill Slips, and, if used with due care and within one week of reception, will duplicate all failures.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY,

Cor. Centre & White Sts., New York.

The New York Dispensary will continue to supply the ***Medical Profession, Health Boards*** of Cities, and all ***Public*** Institutions of the country, either by direct order or through the best dispensing Druggists of this and other cities, with

FRESH ANIMAL VACCINE VIRUS.

The reliable character of the Vaccine Virus furnished by the ***New York Dispensary*** is fully established in the test of the last seven years.

Having discontinued our engagement with Dr. F. P. Foster, and accepted his resignation, the Trustees have elected Dr. Nathaniel A. Robbins, as Vaccine Director, whose whole time will be given to the interests of this ***Department***. Dr. E. A. Lewis will be associated with Dr. Robbins, each having had a long and successful experience in the production of ***Animal Vaccine Virus***.

A recent trip to Europe has given us much valuable information of the most accepted methods of producing Virus. We are prepared to introduce a new stock of Lymph, known as the "Vanves," at present in the highest favor in Germany, Belgium, and France.

Quill Slips (¼ quill charged at square cut end convex surface).	***25c.***
Capillary Tubes,	***$1 00***
Crusts—in powder,	***2.00***
Ivory Points (to order), in packages of 5 to 10,	***75c. to 1.50***

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Sts.; at Laboratory, 94 Pineapple St., Brooklyn; Caswell & Massey's, Broadway and 25th St.; New York Hospital, West 15th St., and of all the leading Druggists in the City.

Liberal terms made with Druggists, Health Boards, and Public Institutions.

NEW YORK DISPENSARY, Cor. Centre & White Sts., N. Y.

DRS. ROBBINS & LEWIS, 94 Pineapple St., Brooklyn.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end),	***20 cents***
Seven " " " "	***$1.00.***
Crusts, (Humanized, first removal from heifer.) each,	***2.00.***

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

SUPERIORITY OF

WARNER & CO.'S

SUGAR-COATED PHOSPHORUS PILLS.

(Twenty-Four Combinations.—See List.)

For EFFICACY, PERFECTION, and FREEDOM from harm, this make of Pills of Phosphorus is unrivalled. The process originated and perfected by W. R. WARNER & Co., for the administration of Phosphorus in pill form, diffuses the Phosphorus, in its elementary state, thoroughly through the mass in a state of solution, a result by no other process attainable. The value of Phosphorus as a remedial agent is impaired if the element is not exhibited in its free state, and protected from oxidation by a perfect and *non-porous coating of pure white sugar.* You are cautioned to avoid cheaper and inferior brands.

MESSRS. WM. R. WARNER & Co., *Manufacturing Chemists, &c.*

GENTLEMEN:—The Phosphorus Pills* submitted to me for Chemical Analysis and Microscopic Examination afford only traces of Phosphoric Acid, and contain the one twenty-fifth of a grain (gr. 1-25) of the element in each Pill, as expressed upon the label; they do not exhibit particles of undivided Phosphorus, the mass being perfectly homogeneous in composition, soft in consistence, and thoroughly protected by the non-porous coating of sugar from the oxidizing influence of the air. Each Pill is an example of what skill, care, and elegant Pharmacy can do. I regard them as a marvel of perfection.

Very respectfully,

A. E. McLEAN, *Analytical Chemist and Microscopist,*

Late of Gardner & Attstie's Laboratory, Edinburgh, Scotland. 40 and 42 Broadway, N. Y.

Original Lectures.

LECTURES ON THE LOCALIZATION OF SPINAL AND CEREBRAL DISEASES.*

By E. C. SEGUIN, M.D.,

CLINICAL PROFESSOR OF DISEASES OF THE MIND AND NERVOUS SYSTEM IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

LECTURE I.

SUMMARY—INTRODUCTORY REMARKS—HISTORICAL CONSIDERATIONS CONCERNING LOCALIZATIONS IN THE SPINAL CORD—PHYSIOLOGICAL ANATOMY, AND PHYSIOLOGY OF THE SPINAL CORD.

GENTLEMEN:—The Faculty having again done me the honor to assign to me some of the extra Thursday Lectures this winter, I have chosen as a subject the very practical question of the Localization of Diseases in the Spinal Cord and Brain.

This topic is now engaging the attention of many of the best minds in the profession, and it is being made the object of careful observation and ardent controversy. Well-reported cases bearing on the question abound in the current medical literature.

The subject has two principal aspects. One of these, that relating to the doctrine of the localization of functions in the brain and spinal cord, is more especially interesting to the physiologist and psychologist. The other aspect, that which concerns us as practical physicians, is with reference to the possibility of making an accurate diagnosis of the seat of the lesion in organic diseases of the nervous centres.

It is this second aspect of the question which I shall discuss with you; and I shall endeavor to do it in as concise and practical a manner as possible—in such a way, in short, as shall enable you to utilize in your future daily practice the various principles and propositions which I shall have the pleasure of presenting to you.

In other words, the following lectures will be upon the rational diagnosis of cerebral and spinal diseases.

In practice, when we have completed the examination of a patient, several questions are put to us by the patient, by his friends, or by ourselves. These are in chronological order: Is there disease? Where is the disease? What is the disease? What are we to do for the cure of the disease or for the relief of the patient? Will the patient die or recover?

Of these questions the one which our client and the world at large consider the most important, is the fourth—that relating to treatment and cure. This preference is natural, but highly unscientific; it is a manifestation of that untrained mental action which demands results and scorns methods, which welcomes empirical achievements (provided they be agreeable), and which conduces to the perpetuation of quackery of all kinds. But to the physician who is not a mere prescription-writer, who aims at infusing as much science into his practice as possible, and who believes that he is not in the world for the purpose of gratifying his patients at so much per visit, but that he owes himself a debt of training and self-culture, and who has a sincere regard for science—to such a physician the first three questions assume a justly great importance. Pray observe that I do not say paramount importance, but great importance. And the superiority of the humanitarian over the scientific duty becomes less glaring if we bear in mind the truth—and I firmly believe it to be such—that success in treatment now depends, and in the future will still more closely depend, upon the scientific study of the human subject in health and disease. In other words, I would impress you with my own conviction that the best trained and most scientific physician, if he be not a closet-student and theorizer, is the best practitioner.

We occasionally hear of an over-fine diagnosis, of extreme caution in the treatment of disease, and of the sweeping application of physiological laws to practice by men who are said to be "too scientific;" but who can number the errors, nay the sacrifices of life which must be laid at the door of the falsely so-called "practical men," who despise learning and scientific methods? Those of us who see something of the rarer and more formidable kinds of disease fully realize that in medicine, as probably in other applicable sciences, ignorance leads to rashness and crudity in practice, while ripe knowledge conduces to success, or, at any rate, to caution in prognosis and expectancy in treatment.

Of the three diagnostic questions: Is there disease? Where is the disease? What is the disease? the second is the one which forms the key-note of these lectures. Where is the lesion producing the disordered actions or symptoms? The method to be followed in arriving at the solution of this question varies somewhat in different departments of medicine. Some lesions can be seen by the trained unaided eye, or felt by the skilled hand; the seat of others can be determined by auscultation and percussion, by the aid of instruments, such as the ophthalmoscope, laryngoscope, speculum, etc. But in the study of the nervous system greater difficulties are met with; we are, to a great extent, deprived of these physical aids; we cannot appreciate the condition of the brain and spinal cord directly by our special senses, but only by a proper interpretation of the way in which the functions of these parts are performed. In other words, the diagnosis must be made chiefly by reasoning.

What are the conditions or data necessary for correct reasoning in nervous pathology? An enumeration of these will be a brief statement of the way in which I purpose treating the questions before us.

First, you should possess a knowledge of the physiological anatomy of the parts concerned, viz., the brain and spinal cord. You are not obliged, for this purpose, to know much of the histology of the nervous tissue, but you should understand the arrangement of its various parts as recently revealed to us by perfected anatomy and embryology.

Second, you must be well versed in the mode of life and action, or physiology of the cerebro-spinal axis. You must understand, as well as the present state of science allows, what parts are excitable and what inexcitable, which transmit impulses and sensations, which receive impressions, which originate the motor impulse, and which are endowed with special functions.

Third, you need a thorough understanding of the perverted functions of the nervous system, and of other systems connected with it—*i. e.*, of the symptoms of nervous disease; you should cultivate semeiology. And it is here more especially that previous general medical training is of great aid to the student of nervous pathology.

Fourth, you must have a clear conception of the

* Delivered at the College of Physicians and Surgeons during the months of December, 1877, and January, 1878.

empirical knowledge already gained by numerous post-mortem examinations of persons who have died with disease in the nervous system. You should not accept every proffered autopsy, but critically analyze before making use of it. You may demand that it shall approximate a physiological experiment in exactness and in simplicity.

Fifth, and not least, it is necessary that you have and use a keen critical and logical sense in the appreciation and combination of the above normal and morbid phenomena, in order that you may arrive at sound inductions.

The importance of the combination of the above notions for the study of nervous diseases is immense. Any hypothesis, to be acceptable, must be based upon anatomy, physiology, semeiology, and pathological anatomy. The various crude theories which have reigned awhile in medicine were such as did not fulfil this requirement: some of them were deductions from anatomical data, others applications *a priori* of physiological laws to medicine, others still based solely upon clinical studies, or upon autopsies. Indeed an effort is now being made to break down the growing doctrine of localization of lesions and functions in the brain by just such a one-sided argument. It is claimed by a high authority that facts of the fourth category (post-mortem examinations) contradict, in a perfectly overwhelming manner, the doctrine in question. Now, I trust that, however feebly I may handle the subject, I shall yet be able at the proper time to give you good reasons why we must decline to accept and apply that authority's facts as he does.

Of the few who now deny that we can accurately localize disease in small parts of the brain during the life of the patient, I would, finally, make this critical remark. Their seemingly crushing argument is based upon what seems to me a fundamental error in the appreciation of natural phenomena, and that is, not making allowance for variability and mutability in the highly organized human frame. We now, since the labors of Darwin more particularly, admit that species in the animal and vegetable kingdoms are not fixed forms, but that they may pass into one another by almost infinitely numerous and delicately graded varieties; we know that the ultimate composition of high organic bodies (proximate principles like albumen) varies somewhat; we are prepared to occasionally find (passing to the human organism) the viscera transposed, or to meet with an exanthematous fever without its rash, with a pneumonia unaccompanied by expectoration, or with a painless peritonitis, etc.; in other words, we are, as naturalists and physicians, ready to admit variability and irregularity in the organism. Yet, in spite of all this general and special knowledge, the opponents of localization maintain that there can be no irregularity in cerebral action, and they say, by implication at least, that the decussation of the anterior pyramids must always take place, and be total. They demand of those who believe in localization that they should be able to make *every* observed case harmonize with their generalizations. Is this reasoning fit to be applied to natural history? Are we prepared to make use of the mathematical method in pathology?

I shall treat, first, of localizations in the spinal cord and medulla oblongata; and, second, of localizations in the brain proper.

I take up the spinal cord and medulla first because the phenomena are there more simple, and there is less controversy about them than there is with reference to the brain.

HISTORICAL CONSIDERATIONS.

The now voluminous literature of diseases of the spinal cord does not teach us much with respect to the localization of its diseases. The writers of the end of the last century and of the first quarter of this—Frank, Sauvages, Rachetti, Abercrombie, Ollivier—adopted a pathological classification, which has been generally followed in systematic treatises since. Frank recognized, in a pretentious section of his great work on medicine, only spinal neuralgia (rachialgia), myelitis and spinitis (rachialgitis), and hydrorachis. Ollivier, in his last edition, 1837, enlarges greatly upon this primitive list, and describes at least eleven morbid conditions of the spinal cord and its membranes. Brown-Séquard, in 1861, besides demonstrating, as he thought, the existence of reflex paraplegia, treats of all diseases of the spinal cord briefly, and makes an attempt at localizing lesions. He admirably points out how we can diagnosticate a lesion occupying one-half of the spinal cord (hemi-paraplegia and spinal hemiplegia), and also how the height of a lesion in the cord may be estimated. Besides, he makes the first attempt at localizing disease in one of the columns of the cord, saying that when the anterior columns are alone inflamed there is paralysis without anæsthesia and little dyssesthesia. He (not knowing of Türck's researches) doubts the pathological independence of locomotor ataxia.

In 1864 appeared Jaccoud's excellent book, which chiefly treats of semeiology and ætiology of spinal diseases. He makes an advance upon previous writers, by considering the question of diagnosis of location of the lesion quite fully, and reaching the following conclusions: 1. Disease in the antero-lateral columns produces palsy without alteration of sensibility; 2. There are no symptoms clearly indicating disease of the anterior gray matter alone; 3. It is easy to recognize if the æsthesodic tract is diseased (sclerosis of the posterior columns) by pain, increased reflex,* and anæsthesia; 4. Lesion in one-half of the cord low down is indicated by hemi-paraplegia, high up by spinal hemiplegia. Leyden, writing in 1874–6, adopts the usual pathological classification, and his work is an admirable treatise. He in numerous places refers to the localization of lesions in the posterior columns, the lateral columns, the anterior cornua, the centre of the cord, and the nuclei of the medulla oblongata, pointing out the diagnosis of each. Hammond, 1876, gives a good *résumé* of the state of knowledge on the subject, basing his classification in part upon notions of localization.

But it is to monographs that we owe most in this branch of pathology.

In 1851 Türck demonstrated the extent and exact distribution of descending degeneration in the spinal cord secondary to cerebral lesions, and in 1857 he found the lesion in locomotor ataxia (then called tabes dorsalis) to be sclerosis of the posterior columns; Dr. J. Lockhart Clarke discovered the lesion of progressive muscular atrophy in 1861–2; Prévost that of infantile spinal paralysis in 1865; Prof. Charcot that of progressive labio-glosso-laryngeal paralysis in 1868; in 1865 the same observer published an autopsy of a case of sclerosis of the lateral columns (three others had been published by Türck in 1856), and in 1873 Prof. Erb, of Heidelberg, and Prof. Charcot delineated the clinical features of this disease—spasmodic

* This word is used in a substantive sense, in imitation of German writers, to designate reflex movements. I think that the word is not much used orally by clinical teachers in this way.

tabes, or spastic spinal paralysis. In 1874 Charcot described a mixed type, in which disease of the anterior gray matter is combined with sclerosis of the antero-lateral column—amyotrophic lateral sclerosis. Disease in the central gray matter has been well studied by Hallopeau 1869–70, and Schüppel, and by Leyden, 1876. During the present year Prof. Flechsig has begun the publication of a series of papers upon the systematic diseases of the spinal cord, a work of the greatest merit, based in greater part upon the author's own pathological observations, and upon his yet more important embryological and microscopical studies upon the structure of the spinal cord (1873–6).

As regards the diagnosis of the location of non-systematic lesions (focal lesions) of the spinal cord we have made no material advance upon the data given us by Brown Séquard in 1861.

Let us now briefly review so much of the anatomy of the spinal cord as is indispensable to the study of the localization of its functions and lesions. I shall take it for granted that you are acquainted with the usual descriptive anatomy of the nervous centres, and call your attention chiefly to their physiological anatomy.

The spinal cord is a mass of white and gray nervous matter disposed lengthwise in columnar form, and varying in relative proportions at various points. This finer arrangement of the gray and white columns is best studied in transverse sections made at different heights in the spinal cord—for example, through its upper cervical part, through the cervical enlargement, through the lower dorsal region, through the middle of the lumbar enlargement, and near the end of the cord. In every such section we find the same parts, white and gray, but the shape of each is very different on the various surfaces. In general terms the gray substance or vesicular neurine is disposed in the centre of the section in the shape of an irregular letter H, with clubbed ends forward. These ends, anterior and posterior, are called horns; they are symmetrical on either side of one section, and the posterior reach out to the very periphery of the cord, dividing the inclosing white substance of each half of the section into two parts, the posterior column and the antero-lateral column. By means of pathological study, by histology, and more especially by means of embryology, these white columns have been much more subdivided. Following the latest arrangement by Flechsig, we find in each lateral half of a transverse section of the spinal cord the following parts, proceeding from behind forward:

1. A small triangular column of varying size, lying next to the posterior median septum, in contact with its fellow of the opposite side, the posterior median column, or column of Goll.

2. Externally to this, lying between it and the inner margin of the posterior gray horn, is a broad band containing the sensory fibres of the posterior roots, the posterior root zone, or *zone radiculaire postérieure* (Charcot), or column of Burdach. These two constitute the posterior column of the simpler classification.

3. A small zone lying next to the periphery of the cord, just anterior to the apex of the posterior horn—the direct cerebellar column.

4. Between that and the body of the posterior horn lies an ovoid mass of fibres, the crossed pyramidal column—derived from the opposite cerebral hemisphere by way of the anterior pyramid.

5. Anteriorly to these two, occupying the sides of the section and reaching inward to the gray matter, we find the lateral columns.

6. Lying in front of the anterior gray horns, and extending forward to the periphery, is the *zone radiculaire antérieure* (Charcot), or anterior fundamental column.

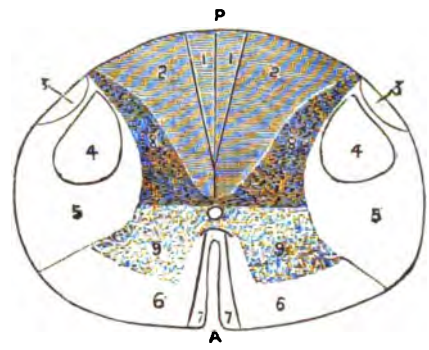

FIG. 1.

Transverse section of the spinal cord.—A. Anterior median fissure; P. Posterior median septum; 1. Columns of Goll; 2. Columns of Gerlach; 3. Direct cerebellar column; 4. Crossed pyramidal column; 5. Lateral column; 6. Anterior fundamental column; 7. Direct pyramidal column; 8. Posterior gray horns; 9. Anterior gray horns. Stippled part=gray matter. Shaded part=æsthesodic system. Unshaded part=kinesodic system.

7. A strip of white matter lying on the margin of the anterior median fissure, extending quite to its bottom, is the column of Türck, or better, the direct pyramidal column—derived from the cerebral hemisphere of the same side, by way of the anterior pyramid.

The simple division of the gray matter into 8. The posterior horn; 9. The anterior horn, will suffice for our purpose. In the accompanying wood-cut the above subdivisions are indicated by numbered spaces.

In an equally aphoristic manner allow me to recall to you the chief physiological attributes of the spinal cord:

1. It is an organ for conduction. Conduction takes place in two directions, centrifugally for motor impulses, and centripetally for sensory impressions. The paths (I will not say fibres) for sensory impressions ascend only a very small distance in the posterior columns (columns of Burdach) before they enter the gray matter, and there at once pass over to the opposite half of the cord (in man at least). Consequently we say that the conductors of sensation decussate in the spinal cord throughout its whole extent. Motor paths, on the contrary, in the spinal cord proper, remain in one-half of the organ white and gray matters; they have already decussated (in part) at the crossing of the pyramids. A strange fact to be borne in mind is that very little gray matter may suffice to transmit all sensations. The illustration (Fig. 2) represents, after Brown-Séquard, the course of sensory and motor conductors.

2. The excitability of various parts of the spinal cord is a point of some interest. It has been quite well settled that no part of the healthy spinal cord is excitable, except the posterior columns; though very lately Professor Vulpian has discovered traces of excitability in the internal part of the anterior column. However, in morbid states, a great change occurs, and even the unquestionably inexcitable gray substance becomes excitable, giving rise to various morbid sensations and to spasm.

3. The spinal cord has an autonomy of its own, giving rise to reflex motor impulses, and producing others spontaneously. It is also probable that sensory impressions are rendered more perfect in the spinal gray matter, but I am indisposed to attrib-

ute consciousness to it. This organ furthermore presides over (executes) many automatic acts, many of them highly complex; such as walking, swimming, standing, to a certain extent eating, dressing, playing upon musical intruments, etc. Part of the spinal gray matter is slowly and painfully educated to perform these actions, and can afterward do them without any marked cerebral interventions.

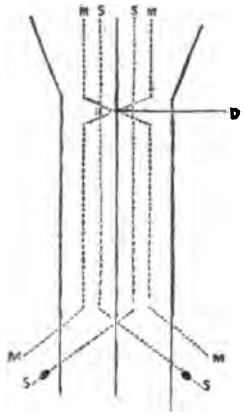

FIG. 2.

Course of motor and sensory paths in the spinal cord, after Brown-Séquard.—D. Decussation of pyramids; M. Motor paths; S. Sensory paths.

4. Besides, the spinal gray matter is supposed to possess a trophic function, to preside over the nutrition of muscles and other tissues, partly through the bloodvessels, and partly directly. This question is under discussion, but the fact remains, that disease of the anterior gray matter produces marked atrophy of muscles, and may cause joint-lesions. The spinal cord is also said to embrace several so-called centres; a genital or genito-urinary centre in the lumbo-dorsal region, a cilio-spinal centre in the lower cervical region, and various subordinate vaso-motor regions; of these I recognize only one as useful in such a study as the one we are beginning, viz., the cilio-spinal centre (Budge, Waller, Brown-Séquard). There is a part of the spinal cord (in each of its halves), extending from the fifth cervical vertebra to the second dorsal vertebra, which contains vaso-motor nerve-fibres for the corresponding side of the neck, face, and eye. It also contains fibres whose normal action is to cause a dilatation of the pupil. In estimating the height of a lesion in the spinal cord a knowledge of the location of this cilio-spinal centre is of real utility.

To sum up the physiology and anatomy of the spinal cord I may divide its section-surface into two great territories, as indicated in Figure 1. The larger part, not shaded, embracing the anterior horns and all the antero-lateral columns, may be designated as the kinesodic system, and the smaller shaded portion, including the posterior horns and the posterior columns, as the æsthesodic system. As the names imply, the latter system conveys and receives sensory impressions, while the latter transmits and originates motor impulses, and possibly is trophic in function.

In the next lecture I shall systematically treat of the localization of disease in these physiological and anatomical subdivisions of the spinal cord; first in the two systems, and second, in each column or horn within each system.

Original Communications.

SUCCESSFUL (INTERNAL) USE OF NITRITE OF AMYL IN DILATED HEART WITH AORTIC REGURGITATION.

BY EDGAR HOLDEN, M.D., PH.D.,

NEWARK, N. J., CONSULTING SURGEON ST. BARNABAS HOSPITAL.

THE following is so remarkable, as showing the efficacy of medication in an extreme and almost hopeless case, that its publication may prove of value in some similar emergency. It is therefore submitted as concisely as possible.

Mrs. H., æt 54, of full habit and a tendency to *embonpoint*, of nervo-sanguine temperament, and without hereditary tendencies to cardiac disease, came first under observation three years since, for dyspnœa, and slight œdema of the feet. A careful examination revealed a soft systolic murmur at the base, with increased area of dulness and depression of the apex beat, with displacement toward the left.

Impulse exaggerated and some increase of arterial tension, as shown by the sphygmograph. The treatment at this time it is unnecessary to dwell upon. An apparently permanent relief, however, was secured, and nearly a year elapsed before a second attack. This was similar, except that albumen was found in small quantity in the urine. During the past eight months more or less treatment has been necessary for slight dyspnœa, occasional nausea, puffiness of the extremities, and the other natural consequences of cardiac disease, up to the 12th of January, ult., when unusual drowsiness, constipation, severe headaches, and occasional attacks of nervous excitement, with scanty urine, indicated the presence of uræmic poisoning. For a few days these symptoms continued, apparently modified by the ordinary treatment for such conditions. Arterial tension, however, gradually increased; the excitement became almost maniacal; the heart beat with extreme violence, but with no great rapidity; the pulse was rarely over 90, the temperature 101°.

Jan. 16th, vomiting, faintness upon exertion, and the intense headache with congested conjunctivæ, sleeplessness and profuse diarrhœa, seemed to show the inefficacy of other remedies, and digitalis, which had usually given relief, was administered at four-hour intervals in doses of ten drops of the tincture. Hoffman's ether, alone or combined with tincture of sumbul and tincture of valerian, with an occasional Tully's powder, were also resorted to as necessity arose. Up to this time it should be stated that digitalis in infusion with acetate of potassa had been employed in conjunction with diaphoretics.

The heart under these circumstances was regular in rhythm. The pulse 90, the arterial tension high; the aortic obstructive murmur clear and distinct, the impulse greatly exaggerated; the apex more displaced than formerly, and some appearance of pulsation below the sternum. At times, however, I fancied there was pulsation in the jugulars. With the previous history of the case it was evident that dilatation was becoming a marked factor in the disease.

Jan. 22d, the symptoms were more favorable. Each dose of digitalis gave relief to such a degree that the patient called for it repeatedly, unwilling to wait the allotted interval. Ten minutes seemed to her to be

sufficient for it to begin its favorable action, and two hours the maximum of its duration. The condition of the kidneys was watched as to the guide to quantity, as suggested by Balfour. For five days improvement progressed satisfactorily; headache (with assistance of monobromide of camphor), excitement, undue violence of cardiac action, nausea, and deficient excretion of urine, ceased to excite apprehension. On the 28th a recurrence of diarrhœa, fulness of the head, and jactitation, with faintness on rising in bed, indicated the increase of the new complication. At each visit the jugulars more clearly pulsated; the heart's impulse grew decidedly weaker, the throbbing below the sternum was visible to the ordinary observer, and on auscultation the obstructive basic murmur was replaced, or rather at first accompanied, by one of a soft-blowing character, diastolic, and therefore regurgitant. The apex beat was undistinguishable. From this time until the 7th of February, a period of ten days, the gradual increase of the symptoms enumerated, prolonged coldness of extremities, faint and irregular pulse, attacks of partial syncope, even upon moving the head, inability to retain nourishment or obtain sleep, and on the date above given (the 7th) a convulsion of clonic character, seemed to indicate the approach of a fatal termination. Both ventricles and the left auricle were immensely dilated, the aortic valves incompetent, and one loud swashing sound could alone be heard at the base. The sight, moreover, was completely gone. Twice during the interval of ten days the urine was examined, and no albumen was found. *With the reduction of the high arterial tension albumen ceased to be eliminated.* No microscopical examination was deemed necessary.

Digitalis was still repeatedly called for, and the suggestion of Balfour, in his recent work on cardiac disease, that bold and heroic doses are indicated in such cases in spite of the general professional belief to the contrary, and the persistent declaration of the patient that she must have it in larger doses, led me to debate the advisability of doubling the already large quantity she was taking (30 *drops of the tincture every two hours*). In this emergency my friend, Dr. Wilmarth, saw the case. To him, as to myself and to the relatives of the patient, it seemed a hopeless one for further medication. It is unnecessary to enumerate the various adjuvant remedies resorted to during this and the preceding days; suffice it to say that, fearing that already too much digitalis was being administered, I ordered its discontinuance. The result was alarming. Gradually the pulse disappeared from the wrist; faintings at intervals of a few minutes; agonizing pain in the præcordia, coldness of the whole surface, lividity of countenance, and three convulsions within the twenty-four hours, during which I boldly withheld the drug, compelled its new administration. Forty drops of the fresh tincture repeated in an hour and again repeated failed, however, to change the aspect of the case, and summoned in haste with the assurance that complete unconsciousness had supervened, I took with me some pearls of nitrite of amyl for inhalation.

The effect of the first one was magical, but of brief duration. Of the second the same; the skin, however, became warmer and the face of more natural color. Feeling renewed confidence, in the absence of any untoward result, and assured that to keep the capillary circulation free was the only means of relieving the overburdened heart, I began internal administration of the amyl, suspended in a mucilaginous liquid (in doses of five minims every two hours). The effect was apparent to the friends from the first, and the return of the radial pulse, the natural character of respiration and gradual subsidence of the fainting attacks, the return of sight to the eyes, and, indeed, a marvellous change which seemed incredible was speedily wrought in all the symptoms of the disease. For five days this dose, with a steady improvement, was maintained.

Proper nourishment was given every hour, and on the 16th of February the interval for the amyl was lengthened to four hours, and so continued to the 21st. From the 21st to the 28th three minims only were given at each dose, and a tonic of quinine, iron, and strychnia added. Feb. 28th, and until March 8d, five minims three times daily were given. From the 8d to the 8th three minims three times daily, and on the 8th all remedies were discontinued. The patient was now able to walk about without discomfort, the diastolic murmur at the base had disappeared, the heart could be examined without pain from the pressure of the stethoscope, and all the evidences of dilatation and aortic incompetency had entirely disappeared.

There remained the old condition of enlargement with displaced apex, the obstructive murmur over the aortic valves with the first sound, and the very slight tendency to œdema of the ankles and feet. March 13th the last call was made, and the patient, who had twice the day before been down-stairs, was permitted to ride, and declared herself well so far as she could herself discover, only asking that she might use digitalis again if she felt its need, as she was somewhat saturated with nitrite of amyl (!).

In conclusion it may be said that while it is not by any means to be inferred that this patient has or will entirely recover, no more clear evidence of the value of any remedy could be adduced than has been here observed, and if, through a desire to avoid exaggeration, the account has failed to present it clearly, it is a matter of regret.

I would add that as convalescence progressed the amyl became somewhat distasteful, and the stimulating effects upon the heart so marked, that it was necessary to vary the dose and interval as described. The sensations experienced were fulness and tingling of the extremities, a sense of warmth and exhilaration, and just before its discontinuance a little nausea.

CASE OF UNRECOGNIZED, FATAL HEMORRHAGIC SMALL-POX (VARIOLA HEMORRHAGICA).

By L. DUNCAN BULKLEY, A.M., M.D.,

PHYSICIAN TO THE SKIN DEPARTMENT, DEMILT DISPENSARY, NEW YORK, ATTENDING PHYSICIAN FOR SKIN AND VENEREAL DISEASES AT THE NEW YORK HOSPITAL OUT-PATIENT DEPARTMENT, ETC.

Two years ago I reported a case of unrecognized, fatal hemorrhagic small-pox in the mother, and fatal small-pox in the new-born child,* and within a year later I was called in consultation by another physician to see a similar case, which had been previously seen by one physician of New York of some eminence without recognizing its nature. This case was also followed by a case of ordinary small-pox in the person of the husband, who recovered. From these cases having passed unrecognized by several physicians, I deem that the existence of this rather rare form of the disease is not a well-established fact in the minds of all practitioners, and therefore think the subject worth presentin gagain by means of this second fatal case.

*Archives of Dermatology, July, 1876, page 297.

This appears to be the more necessary because there is no good description of these peculiar features in the text-books on general medicine or dermatology.

Mrs. E., aged 39, a good-sized and previously healthy lady, five days previous to my seeing her, was seized with a chill, which was not very severe, followed by nausea and vomiting, with some fever. Two days after the chill she began to get flushed in the face, the flushes being of a purplish and rather livid hue, and on the third day some ecchymotic spots appeared on the neck and chest. During this period there was some pain in the back, but this was not severe, and the nausea and vomiting had yielded soon to bismuth. During these first few days there was no sign of a papular eruption, nor at any time was there an amount of any lesion which would be considered as distinctive of small-pox. Hemorrhages began from the mouth on the third day, and soon extended to other localities, persisting until death.

When I saw her, April 24, 1877, the face presented an evenly distributed, purplish, livid hue, with few if any blotches, but, scattered over the purple surface, a few minute papules could be discovered on close examination. The neck and chest were covered with a thickly set eruption of petechiæ, confluent in some places; on the abdomen, where a mustard-plaster had previously been placed, there was an evenly formed ecchymotic surface; the back was pretty well covered with petechiæ. On the thighs the hemorrhagic spots were separate and distinct, of an irregularly roundish shape; they were more thickly set upon the buttocks. The legs were more sparsely sprinkled with them, they reaching even on to the toes. The arms were affected in like manner, the eruption of hemorrhagic maculæ of various sizes and shapes extending on to the hands, and even to the fingers, mainly on their backs.

On many of the petechiæ very close inspection with a pocket lens of moderate power, showed minute pustules, although but a comparatively small number of the hemorrhagic spots exhibited them. On the roof of the mouth there were several fairly developed pustules with ruptured summits.

The eyes were intensely ecchymotic, the tissues of the right eye were raised up in a circular ring around the iris, which appeared as a great depression in the centre: the left eye was less affected than the right, but was the seat of considerable bloody effusion.

The mouth and nose were pouring forth blood, blood was passed by the bowels, there being also considerable pain through the abdomen, and the urine was seen to be loaded with blood in streaks and clots.

The pulse was 120, full and throbbing, temperature 105°; tongue dry and parched; the bowels had been previously moved by ten grains of blue-mass, and she was having loose, bloody stools.

She was conscious, answering questions clearly, and assisted somewhat in the examination, which was very brief, but she complained much of great general distress. She was bled to about twenty ounces, the blood flowing with some difficulty and being of a very dark color. Twenty-five minims of fluid extract of ergot were injected hypodermically into the arm, and this was directed to be repeated every two or three hours. Brandy was to be administered tolerably freely, and to be given by hypodermic injection if vomited.

The patient expressed herself as experiencing the very greatest relief from the bleeding; the pulse became more natural, and she slept. I have not received from the attending physician the promised details of the case after I left her, and only learned that she sank and died within twelve hours after my visit. The family were ordered to be vaccinated at once, but the husband took the disease, as before stated, and was severely affected; I believe all the others escaped.

The interesting points attached to the case are: the peculiar variety of the disease, the small-pox poison manifesting itself almost entirely in the form of the hemorrhages, and the consequent difficulty of the diagnosis; the almost surely fatal nature of this variety of variola; and the necessity of a correct diagnosis for the sake of those around the patient.

In regard to the diagnosis, I need only say that the entire group of symptoms as detailed in this case can be presented by no other disease; purpura hemorrhagica, which it most resembles, would not have the initial chill, nor the fever and throbbing pulse of 120, nor the papules on some ecchymoses and the vesicles or pustules on the others. Black measles, or black scarlet fever, the hemorrhagic varieties of these diseases would also never give the pustular element, moreover would not be so rapid in progress or so violent in character; and would possess other features characteristic of each, as the catarrhal symptoms of measles and the throat disease of scarlatina.

As to the treatment, little if anything has ever availed; the cases are almost surely fatal, and that generally within from three to five days. It was my painful duty to tell the husband that his wife could hardly, by any possibility, live. The treatment followed was such as I should be inclined again to advise, except that it should be resorted to much earlier in the disease. The bleeding was indicated, inasmuch as the throbbing pulse was already seeking relief by hemorrhages from the mouth, nose, kidneys, and bowels, and by thus opening a vein an impression was made on the circulation, and the patient was certainly very much relieved. I should hope most from the hypodermic injection of ergot, which was immediately given; but the disease had progressed too far, and it was possibly not absorbed. In an earlier case I should expect something from it. Too much care can hardly be exercised in recognizing cases of this terrible form of small-pox, as, if undetected, they may give rise to very serious consequences, as in this and the other instance which I have previously reported.

THE CAUSES OF PREMATURE MENTAL DECAY AND NERVOUS EXHAUSTION INDUCED BY INEBRIETY, AND THEIR TREATMENT.

By EDWARD C. MANN, M.D.,

LATE MEDICAL SUPERINTENDENT N. Y. STATE EMIGRANT INSANE ASYLUM AND MEDICAL SUPERINTENDENT "HOME FOR NERVOUS INVALIDS," 152D STREET, WASHINGTON HEIGHTS, NEW YORK CITY.

(Read before the meeting of the American Association for the Cure of Inebriates.)

INEBRIETY as a disease—I might say with propriety an insanity—will never, in common with the other insanities, die out until the Anglo-Saxon race succeeds in producing, what it does not now produce, a physique and a brain capable of meeting successfully the demands that our climate and civilization make upon it. To do this requires a bringing up of the tone of the physical condition of American women, so that the conformation of woman shall be what it should be for the best propagation of the species, and that she shall have, what she has not to-day, the ability to furnish a suitable supply of wholesome nutriment for her offspring, as is the case with German, English, Scotch and Irish women. To-day the vital temperament is deficient in American women, and the nervous temperament is too predominant and too active, so much

so, as to require an undue proportion of the nutrition of the body. Nothing is more certain than that the physical development of most of our American women differs very materially from the physiological standard upon which the true law of increase is based. The remedy for all this lies in your hands, gentlemen of this Association, in common with the rest of the profession, and it is to the subjects of diet, fresh air, sleep and tranquillity of life of the young of the present generation, and to the general training of the young in educational institutions, that we must look for the production of a better type of physical development and mental stamina. I think that the influence of physical culture, especially applied to women, and its influence on the body, cannot be overrated, and that by due attention to this we shall see our young women graduating with health, with good muscular development, and an abundance of vitality stored up for the trying duties of maternity, and with the greatest possible harmony of action between the physical and the mental organization, tending to good health, long life, and healthy progeny. Physiology points to the necessity among our American women for a better developed physical system, more evenly balanced in all its parts or organs, a greater harmony in the performance of all their functions, especially in reference to what may be termed the primary laws of nature, so that their children may not be weighed down in the struggle of existence with the curse of a defective organization, but be blest in the inheritance of a perfect anatomical and physiological structure in all parts and organs, with a resulting harmony in the performance of all their functions, with perfect mental and physical health and immunity from the host of nervous diseases that affect so large a proportion of our people. It may seem as if an undue amount of attention is spent in the consideration of this question, but having, by reason of my specialty, devoted much time in the study and investigation of hereditary disease, I am firmly impressed that, in order to eradicate inebriety and allied nervous diseases, and to check the increasing tendency to physical degeneracy among American people, we must aim at the extirpation of radical defects in physical organization. At present the average number of children to each American family is steadily decreasing with each generation, and the children that are born exhibit a want of vitality, a want of stamina in the constitution, and such a predominate tendency to physical degeneracy that threatens seriously, it seems to me, the perpetuity of our native stock. The pathology of the production of inebriety, in common with most other nervous diseases, consists, primarily, in an interference with the proper nutrition of the cerebral tissue of the fœtus, so that, even during embryonic life, the brain of the infant undergoes pathological changes which induce deficient moral power, mental weakness, and a predisposition to the acquisition of all forms of nervous disease, there being an ill-balanced and defective state of the whole central nervous system disposed to take on diseased action. These diseases would cease to exist if a true, healthy civilization prevailed; but inebriety, in common with other nervous diseases, owes its origin to an artificial type, from wrong habits, pernicious customs and fashions, and from an unnatural culture and refinement where the laws of health and life are altogether too much violated. These diseases have not been the growth of one generation, but of many, and by the laws of inheritance have become greatly increased and their effects intensified. To eradicate these evils, and to perpetuate the race as it should be, there must be sound and healthy stock, and not organizations impregnated from their very origin with the seeds of disease and premature decay.

We find in dipsomania the general symptoms of exhausted nervous power, viz.: general debility of the body, inability to walk even short distances without fatigue, general feeling of languor, unwillingness to make any active exertion, great tendency to sweat, more especially at night, but also induced during the day by the slightest exertion, and often an unsteady gait. I have found these patients exceedingly prone to neuralgia. The explanation of this is probably due to the fact that there exists in such cases a worn, irritable, hypersensitive condition of the sensory nerve-cells of the central sensory tract, which is the sole seat of true nervous sensibility. The central nervous system is affected beyond all doubt by excessive drinking, and the degeneration thus produced I regard as a powerful predisposer of neuralgia of the inveterate type. Aside from the direct influence impressed on the nerve-centres, I think that this irritable and hypersensitive condition of the central sensory tract is often induced by visceral irritative disease of the stomach, kidneys, or liver, so frequently existing in inebriates, which almost necessarily affects the sensory nerves which ramify in these organs, and from these diseased nerves a more or less steady stream of irritative and wearing nervous impressions is transmitted, practically without cessation, to certain parts of the sensory tract, to which the sensory nerves from any given part may go, and, as a result, sooner or later the central sensory nerve-cells are brought into that degree of nutritional disturbance which is the fundamental factor in neuralgia. The real seat of these severe neuralgias, from which so many dipsomaniacs suffer, is rarely, if ever, in the peripheral nerves of the affected region, but in the central nervous apparatus. The heart's action is weak, often irregular, accompanied by palpitation, and not unfrequently with symptoms of indigestion. A change has also come over the man's mind, so that the very *morale* of the mind is changed. At one moment he may be very joyous and excitable, and then he will become greatly depressed. He will be very friendly, and anon very hostile. He will be so obstinate that nothing can overcome his determination, and at other times you may lead him like a child. The heretofore ever-ready and resolute man manifests marked indecision of character, and in other cases there may be an utter inability to fix the mind on any one subject, or to follow up a train of thought consecutively. Any force to cause permanent intellectual activity must be a mental, not a physical, one. If the force be alcohol, which it often is, as it is becoming more and more the habit to resort to it for its temporary effects in this direction, the rate of interest paid for its use is frightful. Not alone is there a loss of tone in character, and blunting of moral perceptions, but intellectual discrimination is much impaired, and impairment of all the mental faculties is almost inevitable. The ideas are more spontaneous, less under the power of control, and any exertion requiring continuous mental effort soon becomes impossible. There can be no doubt that alteration of the brain is taking place *pari passu* with these alterations of character. It may be atrophy, or the circulation through the encephalon may be checked or impeded by ossification, or softening of the cerebral arteries, or some disease of the heart itself, or the neurine may be undergoing a change, particularly on its peripheral surface, as well as on the surface of its ventricles or cavities. The convolutions become paler, and the furrows shallower. The weight of the whole cerebrum and cerebellum is

lighter and less complex. Softening of a very delicate nature, so delicate as only to be detected post-mortem, by letting a little stream of water flow gently over the surface of the brain, may be taking place; or, what is very likely, and is often passed by unnoticed, because discernible only to a well-practised eye, which may not be present at the right moment for observing its attack, is a very slight fit of apoplexy and paralysis, so slight indeed that it occurs and passes away unnoticed and unperceived, and is recognized only in its after-consequences and permanent effects. From the date of such an occurrence, though loss of life does not ensue from it immediately, yet in its ultimate effects it is sooner or later fatal. The patient is an altered man, and never recovers himself. So delicate is the tracery of the nervous structure, that the damage of a single fibre, or set of fibres, destroys the unity of the whole. There are generally three things present that lead to these attacks of cerebral hemorrhage, and as these attacks play a very important part in the production of premature mental decay in inebriates, it is desirable to thoroughly understand them and estimate their importance. The three things alluded to are: hypertophy of the left ventricle of the heart, chronic disease of the kidneys, and finally degenerated cerebral arteries. The hypertrophy of the heart is a simple hypertrophy of the left ventricle, the wall of the ventricle being thickened without any dilatation, although in exceptional instances dilatation may ensue. The blood, in inebriety, is more or less noxious to the tissues, since it contains an alcoholic foreigner, and its passage into the capillaries is undoubtedly resisted by contraction of the small arteries, the vessels most rich in muscular tissue. The muscular coats of these vessels, therefore, are hypertrophied in antagonism to the heart. Since the small arteries are hypertrophied throughout the body, the obstructions, though each is slight, are in their sum total so large that in order that the circulation may be carried on efficiently, hypertrophy of the heart must ensue. There may be doubtless degenerative changes in the small arteries, so that there may be increased bulk with altered structure. It should not be assumed, I think, as it often is, that all the processes in the arteries leading to cerebral hemorrhage and apoplexy are of a degenerative origin, as there can be no reasonable doubt that the presence of alcohol sets up a condition of sub-inflammatory irritation which plays a very important part in the production of cerebral hemorrhage. The sub-inflammatory irritation causes the arteries to lose much of their elasticity, and become permanently wider, longer, and more tortuous. This absence of elasticity of the larger arteries becomes, by the withdrawal of the aid to the circulation in equalizing the flow of the blood, an important factor in leading to rupture of the smaller arteries. When the brain wastes slowly, as it often does, the dilatation of the vessels, and the increase in the quantity of the cerebro-spinal fluid, favor rupture very decidedly. There can be no doubt that the occurrence of cerebral hemorrhage in inebriates, resulting from abnormal strains, would be much more frequent were it not for the provisions which nature has made for the protection of the brain from suddenly increased afflux. The turns of the carotid and vertebral arteries, the free anastomosis of the circle of Willis, and the small size of the arteries beyond that circle, before they enter the brain substance, all tend to protect the brain. The perivascular canals also exercise a protective influence over the vessels they surround, and in the corpus striatum, where cerebral hemorrhage is especially liable to occur, as its vessels are not capillary in size, and proceed from the middle cerebral artery, which is almost the continuation of the internal carotid, we find the perivascular sheaths of very large size. When I say, then, that I consider one of the principal causes, if not *the* principal cause, of premature mental decay occurring in inebriates, to be the occurrence of cerebral hemorrhage, or apoplexy, resulting from degeneration caused by the poisonous effects of alcohol upon the tissues, I do not think I overstate the actual facts. We generally have associated in such cases hypertrophy of the left ventricle of the heart, as I have previously remarked, chronic disease of the kidneys, and degenerated arteries. The strong left ventricle and inelastic arteries combine to prevent the wave of blood sent to the arteries from being properly equalized, and consequently the smaller arteries of the brain, which are normally thinner than the arteries of other parts, and which are degenerated, receive the impulse from the heart's jerks, and being thus diseased and fragile—perhaps dilated and aneurismal—give way.

Before passing to the question of treatment I desire to briefly notice an interesting question, and one with which I propose to deal at length in the future. The question is that relating to the degree of moral or criminal responsibility which attaches to inebriates. Inebriety depends very frequently, as we well know, upon an abnormal organic development of the nervous system that has descended from generation to generation, gaining in intensity all the time. There must certainly be a modified responsibility when homicidal or suicidal acts are committed during periods of such abnormal cerebration. In such cases a criminal act may be committed in consequence of cerebro-mental disease without any apparent lesion of the perceptive and reasoning powers. In these cases also the mental disorder is of a sudden and transitory character, not preceded by any symptoms calculated to excite suspicion of insanity. It is a transitory mania, a sudden paroxysm, probably epileptiform in nature, in which convulsive activity is not reached except so far as the mind is concerned, without antecedent manifestations, the duration of the morbid state being short, and the cessation sudden. In these cases the criminal acts are generally monstrous, unpremeditated, motiveless, and entirely out of keeping with the previous character and habit of thought of the individual. Such attacks are transient in proportion to their violence. There is an instantaneous abeyance of reason and judgment, during which period the person is actuated by mad and ungovernable impulses. I would by no means wish to be understood as advancing the plea that inebriety as a simple habit should exempt or protect a man from the consequences of criminal acts committed while under the influence of alcohol: but if he has unhappily inherited an abnormal organic development of the nervous system, so that mental delusion, weakness, or disease deprived him of the power of choice, and if we can say, but for the presence of those morbid conditions the habit never would have been formed, we should then look upon his inebriety as due to mental disease, and hold him responsible accordingly. If we in each individual case study up its psychological history, we shall always be enabled to come to some definite conclusion. For instance, in a given case, if I can prove to you that an inebriate who has committed some criminal act during one of his paroxysms has had a paternal or a maternal ancestor in an insane asylum, I certainly present to you a strong reason for pausing before you denounce the act as the simple outgrowth of a vicious habit. Again, if a man has committed a criminal act during a paroxysm of

dipsomania which has appeared either in very early youth or in old age, after a long, virtuous, and temperate life, or after a sudden mental shock, or sunstroke, I at once negative to your minds the hypothesis of habitual drunkenness. A very interesting case from a medico-legal point of view occurred a short time since, in which the writer was consulted as an expert. A murder was committed by a man under the influence of a small quantity of stimulants, which stimulus evidently induced a state of temporary insanity, or epileptiform attack. The integrity of the brain had been affected by a previous sunstroke, and the man had just recovered from quite a serious illness. It is well known that after a sunstroke a small quantity of liquor acts very violently upon the nervous system, and it might, therefore, be argued that he was responsible for the voluntary act by which he submitted himself to the influence of the intoxicating liquors. But the facts of the case were that previous to this time he had been accustomed to drink far more than upon this occasion with impunity, and had never before been intoxicated. This man was, therefore, in a morbid state produced by his sunstroke, subject thereby to a tendency to insanity, liable to be excited by intoxication, of which morbid state he was ignorant, having had no reason from his past experience to believe that such results were likely to proceed from intoxication, and with no intention in his own mind to do more than take a very small quantity of stimulus. As you will see in this case it seemed the only proper way to hold this man responsible for consequences which an ordinary understanding could recognize as likely to follow from immediate acts. I gave it as my opinion that the murder, which I will presently describe, was committed during a transitory state of moral epilepsy, which was the result of a preceding sunstroke, the immediate exciting cause being an attack of illness, and the taking of a small quantity of alcoholic stimulus. This state of "moral epilepsy" is a morbid affection of the mind-centres, which destroys the healthy co-ordination of ideas, and occasions a spasmodic or convulsive mental action. The will cannot always restrain, however much it may strive to do so, a morbid idea which has reached a convulsive activity, although there may be all the while a clear consciousness of its morbid nature. The case just alluded to had complained of pains in the head and sleeplessness, which had displayed marked periodicity, and which had been accompanied with great irritability of temper, excited by trifles and seemingly unconnected with personal antipathies. As has been previously stated, the person alluded to had been suffering from quite a severe illness, and after taking a small quantity of alcoholic stimulus, went out to walk. He met a friend with whom he had been familiar for years, and a discussion arose as to the respective merits of certain politicians, when, the discussion becoming excited, the man drew a revolver and shot his friend. He then went, in a dazed and confused state, and sat for some hours upon a river dock, and subsequently went home, burst into tears, and informed his wife of the sad occurrence, and gave himself up at the police station. There was no simulation of insanity by pretending to be incoherent or by strange actions, and no attempt, either on the part of himself or wife, to pretend that the act was an insane one. There was, however, a total blank in the prisoner's mind respecting the events immediately preceding the pistol shot, which shot seemed to have aroused his attention for the time, and he had no recollection of the fact that he sat on the dock for some time afterwards, as he was seen to do. Upon being consulted, as I have stated, I gave it as my opinion that there had existed, for months previous to the occurrence, a profound moral or affective derangement, which from its marked periodicity was evidently epileptiform in character, and that the sudden homicidal outburst supplied the interpretation of the previously obscure attacks of recurrent derangement. There had evidently been induced by the sunstroke in this case an epileptiform neurosis, which had been manifesting itself for months, chiefly by irritability, suspicion, moroseness, and perversion of character, with periodic exacerbations of excitement, all foreign to the man previous to the attack of sunstroke. There are a great many cases among dipsomaniacs where, in an unconscious condition, persons can progress from odd or eccentric actions to deeds of violence, suicide, or murder, being unable to remember the circumstances afterwards, and, therefore, irresponsible for their actions. The question as to the degree of mental responsibility attaching to such cases is one of great interest to psychologists and also to jurists, and one to which it is hoped in the future much more attention may be directed than in the past.

Treatment.—In the treatment of nervous exhaustion and premature mental decay, we should primarily direct our attention to the direction of the mental habits. We should endeavor to provide, constantly, easy and pleasant occupation of the mind, avoiding, equally, lazy inaction or violent excitement. We have in these cases to deal with a worn, irritable condition of the nervous system—an unstable condition, as regards its nutrition, its solidity, and its perfection of structure, which makes our task no light matter. We must be very careful that we make our patients sleep, or we shall have a preponderance of waste over repair that will balk all our efforts. Our patients, by reason of the hereditary factor generally present, cannot, without great danger to themselves, do or endure what other patients might safely do. It will be also necessary to supply the greatest amount of nutritive material to the brain and nervous system to repair the undoubtedly existing nutritive lesion. We must quiet all abnormal nervous excitability and keep our patients calm and tranquil. Attention should be paid to maintaining an even temperature of the body. Care should be paid to the condition of the excretory functions of the skin, kidneys, and bowels. If there is headache and drowsiness, such diuretics as the liq. ammoniæ acetat. with sp. nitric ether are indicated. Indian hemp has also proved itself in my hands a valuable adjunct in doses of ¼ gr. of the extract as required. Free exposure, without fatigue, to the fresh air cannot too strongly be insisted upon. One of the most valuable of remedial agents is phosphorus, which I always prescribe to be administered in cod-liver oil in doses from $\frac{1}{100}$ to $\frac{1}{60}$ of a grain after meals. The cod-liver oil is one of the best nutritive remedies, as fat must be applied to the nutrition of the nervous system if this is to be maintained in its organic integrity. The general effects of phosphorus are those of a stimulant, but it possesses a special power over the exhausted nervous system. It is, perhaps, evanescent in its effects, but is never followed by a stage of depression which is noticeable. It should never be ordered upon an empty stomach. Quinine and strychnine are also very valuable as nerve tonics, and I have obtained excellent results from the use of a pill introduced to the profession by Dr. Wm. A. Hammond, composed of phosphide of zinc and ext. nux vomica. This I regard a specially valuable combination. When there is persistent insomnia, I am accustomed to rely on the use of prolonged warm baths given at bed

time, conjoined, when necessary, with the use of the monobromide of camphor, in doses of from four to six grains. This is an admirable cerebral sedative.

I come finally to speak of the remedial agent which, in my opinion, far surpasses all others in its permanent effects, and which is comparatively little used. I refer to the judicious use of the constant and induced currents of electricity. The essential difference in the action exerted upon the nervous system by the use of electricity, and that produced by drugs very often prescribed, is as follows: Many of the remedies commonly employed in the treatment of nervous diseases and in dipsomania for the purpose of restoring lost nerve force are *nerve stimulants* and not nerve tonics, in the proper sense of the term.

Electricity is a remedial agent which furnishes us with the means of modifying the nutritive condition of parts deeply situated, and of modifying the circulation to a greater extent, I think, than by any known agent. By the judicious employment of the constant and induced currents, we have it in our power to hasten the processes of nerve growth and nerve repair, and thereby indirectly hasten the acquisition of nerve power. The use of electricity does not, I think, act by contributing anything directly to the growth or repair of nerve tissue. Its action, it would seem most probable, is to stimulate and quicken these processes on which the material and functional integrity of the nervous system depends. The action of electricity is always followed, in my practice, by an increase of strength and nerve force, and the results gained are gradual and permanent, while the use of nerve stimulants has always seemed to me to primarily excite the nerve activities proper, and *not* the nutritive processes upon which the acquisition of power depends. The deceptive results obtained from the use of nerve stimulants depends upon the excitation of nerve activities and the resultant expenditure of nerve power, which is followed by a period of exhaustion varying in degree and duration. The careful and judicious employment of electricity has always led in my hands to an increase of nervous energy, while the employment of nerve stimulants has appeared to me to lead, in many instances, ultimately to a waste and diminution of nervous energy. In cases of dipsomania we have, as I have already remarked, abnormal nervous excitability, conjoined with cerebral exhaustion, and the two indications which are urgent are, primarily, for increased rapidity and effectiveness as regards the process of nerve nutrition, and secondarily, to secure freedom from excitement and diminution of nerve activity, and thereby to check the waste of nerve structure and of power. These indications we can fulfil by the judicious use of electricity and nerve tonics more certainly than by any other means, there being no other such combined sedative, restorative, and refreshant to the central nervous system, and we can thus successfully meet all the indications in cases of cerebral exhaustion and threatened mental disease, except that of affording direct nutriment to the brain; which, as I before stated, I endeavor to obtain by rest, cod-liver oil, phosphorus, etc. The use of electricity seems to supply to the system, in cases of inebriety, the stimulus which has been withdrawn; as my patients have repeatedly told me that, while under treatment, they experienced little if any of the terrible feelings produced by its withdrawal under ordinary circumstances. I have seen this so often that I advance it as a scientific fact, and not as an untested theory. I have had cases of years, standing who have assured me that the application of the electricity has been of more service to them than anything they had previously tried. I have generally employed both currents, the constant and the induced, using the negative electrode at the lower end of the spine, or at the pit of the stomach, while I applied the positive pole to the head, cervical sympathetic, the cilio-spinal centre, or region over and on either side of the seventh cervical vertebra, and up and down the spine, making a séance of perhaps fifteen or twenty minutes daily, and in some cases twice a day. I have obtained such excellent results from its use, that I hope other gentlemen presiding over similar institutions to mine may be induced by my success to give this very important remedy an extended trial, after which I feel sure that they will never willingly relinquish so effective an agent.

Reports of Hospitals.

PENNSYLVANIA HOSPITAL, PHILADELPHIA.

Notes of Practice and Peculiarities of Treatment.

Clinic of J. M. Da COSTA, M.D.

I wish to call your attention to-day to three very interesting cases of pulmonary disease.

I. CATARRHAL PNEUMONIA AS A CAUSE OF PHTHISIS. II. HEREDITARY PHTHISIS.

Case I.—P. G., aged 31, a sailor. His father died of dysentery, and his mother of some brain disease. The patient had always been an intemperate man, and, for the last six or eight years or more, has been leading the life of a vagrant. On one of his "outings," some six years ago, he passed the night asleep in the grass in Central Park, in New York City. As a result of this imprudence he caught a severe cold, and was confined to bed for ten days or two weeks, with fever and cough. His present disease has had evidently, therefore, an acute beginning. He has never been entirely free from cough during the past six years. One year ago the pulmonary symptoms became alarming. He had an exhausting hemorrhage, followed by a chronic and copious mucous expectoration containing every now and then some blood-streaks. The man did not lose flesh at first, but of late he has gone down considerably in flesh and strength. There has been an occasional night-sweat of late. When admitted to the hospital he complained of pain in the left side. His temperature was 102°. Physical examination revealed crackling râles and prolonged expiration throughout the whole right lung, except at the apex, where there were to be distinguished the signs of a small cavity. At the apex of the left lung there was found slight harshness of breathing, and some few crackling râles.

I will make an examination now, and see how matters stand to-day. I may first remark, however, that the patient's temperature has recently gone down to normal from 103°, what it was when he was admitted. Dulness upon percussion is very marked over the whole of the right chest. Auscultation shows coarse, crackling râles, and hollow breathing at both base and apex anteriorly. Posteriorly, I can distinguish harsh respiration and some crackling râles at the lower part of the chest. There is harsh breathing at the left apex, both anteriorly and posteriorly. The physical signs have not varied since the man entered the hospital. This much we can say, therefore, that the physical signs have been stationary, and that the temperature

has been steadily declining, until lately it has reached about the normal. Taken together, these two facts lead me to consider the prognosis much more favorable than when the patient first came into our hands. (The man's nails are plainly clubbed, and he has the reddish blue so-called zinziber line upon his groins. There is not the least doubt, therefore, that this case is one of phthisis.)

How has the patient been treated? We have given him inhalations of carbolic acid, cod-liver oil, iodide of potassium, and a liberal diet. Under this *régime*, as you see, the man has gained several pounds in weight, his temperature has been reduced, and the physical signs rendered stationary.

What was the origin of this case? In looking back over the past six years, we see that the malady had an acute beginning; that the starting-point was an exposure, followed by a severe attack of fever and cough, as he calls it. This was, no doubt, an attack of acute pneumonia of the right lung. Up to the time of attack he had always been in good health. Since that date his health has gradually failed. The right lung has become chronically indurated, tubercles have formed in it, and part of the tissue has at last given way, leaving a cavity.

The long duration of this case is very significant when taken into consideration with the prognosis. If he had taken good care of himself at almost any period during the past six years, the tubercular disease might have been altogether prevented, the pneumonic disease in the right lung arrested, and the left lung saved altogether. Even at this late date you see how much good a well-directed treatment has wrought.

You will ask me, perhaps, when the tubercular disease began. I think most probably that it first made its appearance about the time that the hemorrhage occurred, and the man began to notice that he was losing flesh rapidly.

You may be surprised that the disease has been checked at so late a stage in its course, but let me assure you that we are constantly meeting with just such improvements as this one. As soon as I felt sure that the temperature had become stationary at the normal, or a little above, at that very moment was I confident that the disease was stayed, at least temporarily, perhaps permanently.

Case II.—H. M., aged 30. Family record good. Caught a bad cold while playing cricket last summer. Has had a cough ever since, but no hæmoptysis. There has been some mucous expectoration in the mornings, and complaint has been made from time to time of pains in the left shoulder-blade. The patient has only been in the hospital for a few days. His temperature has been as high as 104°, and has shown a very marked morning and evening variation, running from 103½° down to 99°, and then up again to 102½°. The man's respirations are somewhat hurried, there being from 26 to 28 respirations made in the course of a minute. Percussion shows that the resonance is impaired over the whole of the right lung, both anteriorly and posteriorly. Upon *respiratory percussion* (this is a term employed by Professor Da Costa to signify percussion of the lungs after a full breath has been taken and held), this dulness is rendered still more evident. On the left side the resonance is clear. Throughout the left lung the respiration is harsh and the inspiration feeble. Scattered through the lung we find a number of fine râles. Before admittance to the hospital the man lost much flesh, but there has not been any loss lately.

Case II. is in the same condition that Case I. was in some five years ago. Here also there has been a subacute attack of catarrhal pneumonia followed by some consolidation of lung-tissue. This form of the disease is that known as chronic pneumonia, and leads to a more permanent consolidation and hardening of lung-tissue. The case has developed considerable irritative fever. The man is just on the threshold of pneumonic phthisis. Unless the disease is checked, phthisis, I say, will almost certainly supervene. As you see by what has been said above, we have to deal with a high temperature, and yet I have every hope of restoring the man to health.

Let me say a word to you just here concerning the range of temperature in these cases of catarrhal pneumonia, for in cases such as these the range of temperature is a very accurate means of diagnosis. You noticed what an extraordinary difference was found to exist between the morning and evening temperature, running from 103½° down to 99°, and then up again to 102½°. Now, I want to impress upon you the fact that this excessive variation in temperature is peculiar to cases of chronic catarrhal pneumonia. Upon more than one occasion I have been called in consultation to see supposed cases of intermittent fever, which upon careful and thoughtful examination were found to be nothing else than instances of the above affection, viz.: chronic catarrhal pneumonia. The attending physician had been misled by this extraordinary daily temperature range.

Now, as regards the treatment of this man. The first indication with such a temperature chart is, of course, to lessen the fever. For this purpose the two best remedies are quinia and digitalis. Salicylic acid and carbolic acid have been tried with the same object in view, but they have failed. The quinia and digitalis should be administered either separately or in combination, so long as the fever lasts. This man is taking them together, one grain of digitalis and two grains of quinia thrice daily. When cough is among the symptoms, opium should be given along with the above. If the dose of digitalis proves too large, the amount should, of course, be reduced. As there are occasional night-sweats here, the man is taking atropia (see treatment for next case—hereditary phthisis). The atropia must be stopped so soon as the night-sweats disappear, which usually will be in the course of four or five days. To promote absorption and produce counter-irritation, blisters are applied to the chest, and the following prescription administered:

℞. Potassii iodidi..... gr. v.
Ammonium muriatis..... gr. x.
Mist. glycyrrhizæ comp..... f. ℥ ss. (½).
M. S. Four times daily.

I have brought these cases before you to illustrate one of the means of origin of phthisis, and to impress upon your minds some important points of diagnosis and practice in such cases.

HEREDITARY PHTHISIS.

The patient is a young man, 23 years of age, with a wretched family history—his mother having died from phthisis. The man himself states that he has always been in good health until about eighteen months ago, when, without any warning whatever, he had a severe and copious hemorrhage from the lungs. Since that time the hemorrhages have recurred frequently, so that he has had thus far twenty-two hemorrhages in all. He had no cough before the first hemorrhage, and thought himself in perfect health: since the hemorrhage there has been copious expectoration, night-sweats, and progressive asthenia. In

short, this man, coming of a tubercular stock, has a violent hemorrhage, followed in time by all the evidences of tubercular disease. Upon examination I find the signs of the existence of the cavity in the upper part of the right lung. When admitted to the hospital the man's temperature was as high as 103°. Lately it has been reduced below 100°. This case shows that, even when far advanced, phthisis may show partial arrest, if not decided improvement, provided there be no febrile irritation.

The disease in the present instance evidently took its origin in the acute hemorrhage; we find no history of catarrhal pneumonia here. This form of the disease was formerly styled *phthisis ab hæmoptöe*—phthisis from hemorrhage. Modern physicians have been accustomed to deny altogether the possibility of such an origin. They say that in all such cases there are in reality latent tubercles; that if we examine closely enough, we always discover a family history of tubercular disease; that the hemorrhage is, therefore, only a local expression of a general diathesis. Within the past few years, however, the old theory has been revived. According to the views of Niemeyer, the infusion of blood into the lung may be followed by pneumonic infiltration, so bringing on tubercular disease. You will perhaps ask me where I stand in the matter. I will grant the possibility of a case originating in hemorrhage, but I maintain that in the vast majority of cases there will be found to have been previous latent disease. This man's mother died of phthisis, so that, although he considered himself entirely well at the time of the hemorrhage, his lungs must have already become the seat of tubercles.

As regards treatment, the man has been put upon quinia, cod-liver oil, and a nourishing diet. No inhalations have been tried in this case. The man has been in the hospital for four weeks, and during that short space of time he has gained *nine pounds*, the fever has markedly declined, and the physical signs have become stationary.

I have treated the night-sweats very successfully in this and other cases with granules of atropia—$\frac{1}{80}$ to $\frac{1}{60}$ of a grain every night before retiring. This atropia treatment was first started here, and it has been very generally adopted elsewhere, as the best means of checking colliquative sweats, both in phthisis and in other affections; after taking from $\frac{1}{80}$ to $\frac{1}{60}$ of a grain of atropia every night for four or five nights the sweating is usually entirely checked. It has been objected to this atropia treatment that it produces great dryness of the throat. I have endeavored to counteract this effect by the use of strong lemon-juice, lemonade, gum-water, or slippery elm conjointly with the atropia. Quite recently I have obtained the very best results by means of jaborandi combined with the atropia. The doses of jaborandi must be exceedingly small. I have not yet made trial of this combination in a sufficient number of cases to enable me to make an authoritative statement. All I can say is that I have been able to produce entire toleration of the atropia in every case in which the jaborandi was combined with it. The atropia checks the great drain of the sweats upon the system, and so gives the other remedies a chance to act.

FATAL FIRE IN TIENTSIN.—Advices from Shanghai to February 3d state that a great conflagration had occurred shortly before in Tientsin, in which the Asylum for Women and Children was destroyed. It was said that over 2,000 lives had been lost in the fire.

Progress of Medical Science.

LITHOTRITY.—Three to five minutes is the limit usually prescribed in the operation of lithrotrity, but Prof. Bigelow, of Harvard, reports eight cases in which the time varied from three-quarters of an hour to three hours and three-quarters. The danger to the bladder and urethra, Prof. Bigelow believes, is overestimated, and he is convinced that it is advisable to protract an operation indefinitely, if the stone can be thus entirely removed. To facilitate the removal of the fragments, he employs an evacuating catheter of his own device, those now in use being worse than useless. This instrument is of full size, either straight or slightly curved towards the end, and has one opening of large size and situated at the side of the extremity; a rubber ball is attached to it by a length of rubber pipe, thus enabling us to syphon off the contents of the bladder. When the instrument is introduced it is directed against the floor of the bladder, forming a depression, care being taken to turn the eye of the catheter down. Water is now injected from the bulb; in a few minutes the crushed and pulverized fragments gravitate into the depression about the beak of the instrument, the bulb is lowered, and the contents of the bladder syphoned off. The great object is to sufficiently pulverize the stone and effectually evacuate the fragments, and it is for this that the lengthened sitting is required. Of the eight cases cited one died, but the results in the other seven were so favorable, that it is to be hoped this plan may be tested further. None but phosphatic stones were operated upon.—*American Journal of Medical Sciences*, January, 1878.

DUBOISIA MYOPOROIDES.—This is an indigenous tall shrub, growing plentifully in the forests of Eastern Australia, and supposed to belong to the order scrophulariaceæ, though Prof. Oliver, of Kew, refers it to solanaceæ. Dr. G. Fortescue, of Sydney, sent to Mr. Tweedy a small quantity of the extract of this shrub, calling attention to its powerful and rapid action as a pupil-dilator and paralyzer of the accommodation. The drug was experimented with by Dr. Sidney Ringer and Mr. Tweedy: the former found that when applied topically, or administered internally, duboisia dilates the pupil. Given internally, it also greatly dries the mouth, quickens the pulse, causes some muscular weakness, drowsiness, and headache—the same symptoms that follow atropia. It also checks perspiration, controlling even the effect of jaborandi. It antidotes the action of muscarin on the frog's heart. Mr. Tweedy found that, applied locally, duboisia is more prompt and energetic than atropia. Applied undiluted, it causes severe smarting and profuse lachrymation, but when diluted with twenty parts of water these effects are avoided and the dilatation is more rapid and complete. Having satisfied himself that the drug was not likely to prove harmful, he resolved to employ it in all cases where atropine was indicated, and has consequently used it largely in injuries and diseases of the cornea, in iritis, in spasm of accommodation, and whenever it has been necessary to paralyze the accommodation. Its action has in all instances been beneficial, and in some cases, he has been tempted to believe, superior to that of atropia.—*The Lancet*, March 2, 1878.

HOTEL DIEU, PARIS.—Two new wards have been opened, each containing twenty-four beds.

INSANE ASYLUM MANAGEMENT IN THE STATE OF NEW YORK.

Our recent criticisms upon the financial management of the Insane Asylum at Utica have given rise to considerable comment, not only in professional circles, but among the laity. The facts which we presented at the time were matters of record, and were analyzed with a care which their importance seemed to demand. The conclusion seemed irresistible that the management was extravagant in the extreme—in fact, that the Utica Asylum, during the past eight years, had cost the State of New York over six hundred thousand dollars in excess of what might have been expected, comparing it with the expenditures of other asylums. This was a legitimate inference from the stubborn logic of figures presented in the different official reports of the asylums under consideration. We were free to say that there was a reasonable explanation for the apparent discrepancy, and that the high standing of the Medical Superintendent of the institution was in itself an implied guarantee that the standpoint which we were forced to take was untenable. Our prejudice was so strong in favor of the management of the asylum, that it was a matter of some surprise to us that there should appear to be so many grounds for complaint. At all events, we were satisfied to leave the question in doubt, pending some reply from Dr. Gray.

Notwithstanding nearly three months have elapsed since the criticisms were made, we are still hopeful that at no distant day the explanations will be forthcoming, and will disprove many, if not all, the charges of mismanagement. Possibly, one of the reasons for delay is that the subject has, at the instance of the Medico-Legal Society, become one of legislative inquiry, and at the conclusion of the latter the necessary facts may be made public.

Whatever may be the reason for this unseeming procrastination, it is in the interest of Dr. Gray that the investigation be thorough, above board, and as speedy as circumstances will admit. It is a poor excuse to urge against any such investigation, and in the face of the facts and figures before the public, that personal malice against the Superintendent is at the bottom of it. If the latter is the case, the more effectually can an impartial examination destroy its influences. Aside from the charge of personal malice in this inquiry, and the delay in denying the significance of the facts presented, it is extremely unfortunate that the friends of Dr. Gray should have laid themselves open to the suspicion of attempting to dodge the issue. This is indeed the most surprising feature of the whole affair. The very necessity for such a thing was doubted from the first, and should least of all be made apparent at a time when the profession is anxious to hear from Dr. Gray himself. We have before us a report upon the condition of the Utica Asylum from the State Board of Charities, which on its face is very creditable to the institution and its management. Certain charges made by Dr. Tourtellot are reported to have been formally withdrawn, and the committee state that "the whole investigation tended to increase their confidence in the administration of the institution, both medical and financial." This is well enough, and is what would have been expected, in fact would have settled the question as far as the committee was concerned, except for the very damaging statement in another part of its report, to wit: "They did not go into the examination of the accounts, as that would have been a duty entirely beyond their strength and time." In our charity for the committee we are willing to charge this to ordinary stupidity, but to others it might suggest the possibility of trying to prove what with them was obviously impossible. In the absence of any statement to the contrary, we are free to believe that this report is published in connection with the present discussion without the approval of Dr. Gray or of his immediate advisers.

THE NEW SCHOOL BILL.

The friends of school hygiene have reason to be encouraged by the passage of the bill limiting the ages of attendance upon public schools. It will be remembered that last year an effort was made to accomplish such a result, but was, for reasons not necessary to recapitulate, unsuccessful. During the present session a healthier sentiment seems to prevail among the members regarding sanitary matters, and there is a disposition to anticipate the wishes of the public regarding them, rather than to oppose them, as heretofore. It is perhaps due to this fact that the action has been a trifle precipitate, and has consequently fallen short of the intention of the original movers in the reform. By this new law the minimum age of attendance is fixed at five years. Although this is a great improvement over the provision in the old law, when this age was fixed at four years, it is still sus-

ceptible of another change for the better by increasing the age to six years. This is what was originally asked for, and we are assured that it was only by the merest oversight that it was not obtained. Still, we must be content, for the present, with what we have, and take courage for the future. By this slight modification in the old bill fully eight thousand infants will be relieved of school attendance, and not only have the advantages of being nursed at home, but of giving room for many older ones who have heretofore been crowded out. If the six-year provision had been incorporated in the present bill, fully eight thousand more infants would have escaped the unsanitary abominations of the cellar class-rooms. In the case of the latter children some changes can be made in their hours of attendance which may mitigate many of the evils under which they are at present suffering. If they cannot be relieved from school attendance altogether, their time of attendance can be much lessened. The law requires two sessions daily, but there is no special provision for the length of the second. The Board of Education exercises its discretion in this matter by allowing, on special occasions, two sessions to be counted, when the schools are dismissed immediately after the reassembling in the afternoon. If this were made the rule with the children of six and even seven years of age, we should make as near an approach to a rational system of school hygiene as the present law would allow. We see no reason why the Board of Education cannot make an effort in the direction of such a reform, and repeat the gratifying experiences of 1871, when, at the suggestion of the Medical Superintendent, this plan was put in practical operation. But in reality this change needs no argument to prove its utility.

THE EPIDEMIC OF TYPHUS AND TYPHOID, which is raging in the Caucasus, and decimating both the inhabitants and the Russian troops, began originally in some barrack-hospitals. An idea of the violence with which the epidemic began, may be gathered from the fact that almost all the physicians, assistants, and Sisters of Mercy, in these provisional hospitals were attacked and succumbed to these dread fevers. From the barracks the disease spread rapidly throughout the Caucasus and the conquered territory in Armenia. In the latter, it rages with especial violence in Kars and Hassan-Kale.

EPIDEMIC OF TYPHOID IN WITTENBERG.—During the last two months of 1877, a violent epidemic of abdominal typhus raged among the troops in garrison at Wittenberg. The fact that the disease attacked almost exclusively the patients in the garrison-hospital led to an investigation of the water supply of the hospital. Examination of the water, which was taken from a well in the court of the hospital, showed that it contained a very large percentage of ammoniacal constituents. This well was at once closed and another opened in a more favorable location. This prompt action was immediately followed by a diminution in the number of typhoid cases, and the epidemic may now be regarded as entirely over.

Reports of Societies.

NEW YORK ACADEMY OF MEDICINE.

Stated Meeting, April 4, 1878.

DR. S. S. PURPLE, PRESIDENT, IN THE CHAIR.

REPORT OF A CASE OF FALLOPIAN PREGNANCY, WITH SPECIMEN.

DR. LAURENCE JOHNSON reported a case of Fallopian pregnancy occurring in a woman æt. twenty-nine years, married, and the mother of two children aged respectively four and a half and two and a half years. She had always been healthy. Her last menstruation commenced on the 11th of February, 1878, and continued the usual length of time—three or four days. There was no evidence of pregnancy except the non-appearance of the menses on March 11th. On March 23d, at about noon, she suddenly began to suffer from pain referable to the pelvic region, became faint, and was put to bed. Small quantities of brandy were given at intervals, and she partially regained her strength, but in the evening there was a return of the faintness. She vomited once or twice, and had an evacuation from the bowels. The doctor saw her for the first time soon after the attack of fainting in the evening; found her very pale, with a feeble pulse, 140, but there was no discharge of blood from the vagina.

March 24th.—Patient appeared somewhat brighter; pulse somewhat stronger, but rapid. Urination without pain; abdomen somewhat tympanitic; tenderness all around the uterus, but especially upon the right side. Pain was not a prominent symptom at any time during the entire history of the case, although at no time was she markedly under the influence of narcotics.

March 25th.—Patient sank rapidly, and was thought to be dying. She rallied, however, so that on March 26th she was comparatively bright. On the night of the 26th she sank and died, *four* days from her first attack of faintness.

Autopsy, twenty-four hours after death.—Pelvic cavity filled with blood. Ruptured cyst in the right Fallopian tube, close to the uterus, and probably not larger than a hickory-nut. Right ovary contained a recent corpus luteum. Uterine decidua very apparent. Little or no evidence of peritonitis.

Dr. Johnson raised the following important question: *Would not an operation, with the view of securing blood-vessels, have been feasible and justifiable immediately after the occurrence of the first hemorrhage on the 23d of March?*

METHOD OF TREATMENT SUGGESTED BY DR. EMMET.

DR. T. ADDIS EMMET, in the light of a case reported by Dr. McBurney, and which was seen in consultation by Dr. Thomas and himself, believed it to be a feasible operation, as soon as the Fallopian pregnancy was recognized, to first dilate the uterus, then dilate the tube, and in that manner remove the fœtus. Dilatation of the uterus took place when only a moderate quantity of fluid was enclosed in its cavity, and at the same time the fluid backed into the Fallopian tubes. He therefore was perfectly satisfied that, with proper instruments, the uterus could be safely dilated, and also the Fallopian tube, and, as the cyst was usually near the body of the uterus, its contents could readily escape into the cavity of the uterus when such dilatation was effected. Dr. Emmet then exhibited an

India-rubber cot, such as he had been in the habit of using during the last ten years for the purpose of dilating the uterus. The dilator was manufactured by Shepard & Dudley, and consisted of an India-rubber cot containing a tube into which a sound could be introduced, so that it could be carried to the fundus of the uterus; an additional fixture permitted the attachment of a Davidson syringe, by means of which the cot could be distended to any degree required. When the uterus had been dilated, a curved sound could be used, and the cot introduced into the Fallopian tube, and dilatation produced as in the former instance.

FEASIBILITY OF A SURGICAL OPERATION.

Dr. Emmet was of the opinion that as soon as rupture of the cyst occurred it was a proper operation to immediately open the abdomen and secure the bleeding vessels; for, in comparison with such operations as ovariotomy, opening the abdomen for that purpose was a simple affair.

Dr. Post referred to a case reported to the International Medical Congress by Dr. ——, of Georgia, in which laparotomy was performed for that purpose, and with good results.

Dr. Sell approved of the operation.

SYMPTOMS OF NERVOUS EXHAUSTION (*Neurasthenia*).

Dr. George M. Beard, in reading a paper upon the above subject, remarked that, although the condition of nervous exhaustion was sufficiently common to fall under the almost daily observation of every large practitioner, yet many of its symptoms were but ill-understood, and were either unnoticed or confounded with the symptoms of other and quite different disorders. Nervous exhaustion was regarded as a disease of itself, and one which had an array of symptoms peculiar to itself. Some of the symptoms were somewhat familiar to all medical men everywhere; others were familiar only to those who gave their time chiefly to the nervous system; and others still were then described for the first time. Some of the symptoms were of such a positive character, were so frequent as well as so peculiar, that they gave names to diseases, and for convenience sake were spoken of as diseases, although they all were but the manifestation of the nervous exhaustion, or neurasthenia. The following symptoms were mentioned:

TENDERNESS OF THE SCALP.

Tenderness of the scalp was a phenomenon of cerebral irritation, and was to the head what spinal irritation was to the spine. The tenderness might be confined to the vertex, might extend over the entire scalp, or might be limited to certain parts of the forehead. Like spinal tenderness, it was superficial and peripheral, and was not constant, but came and went, according to the exciting cause.

TENDERNESS OF THE SPINE AND OF THE WHOLE BODY.

When the spine was so tender as to become an important and permanent affliction and to overshadow other symptoms of the neurasthenic state, it was called spinal irritation, but strictly it was a symptom like cerebral irritation, and not properly a disease as such, although as a matter of convenience there could be no harm practically in describing it as a disease. The following points were regarded as noteworthy: 1. it occurred with great frequency among the higher classes, especially among women; 2. General and local hyperæsthesia, appearing and disappearing under any subjective or objective exciting causes; 3. It was transient in character.

TICKLISHNESS.

Nearly all persons were susceptible to the form of irritation called tickling, but in nervous exhaustion such susceptibility might become a severe annoyance.

DESIRE FOR STIMULANTS AND NARCOTICS.

When the nervous system, from any cause, lost much of its nervous force, so that it could not stand upright with ease and comfort, it leaned upon the nearest and most convenient artificial support. Whatever was capable of temporarily propping up the enfeebled frame, anything that gave rise to sedation and oblivion, as chloroform, chloral, opium, or alcohol, might be resorted to at first as an incident, and finally as a habit. Frequently an inherited tendency to inebriety was for years utterly latent, and did not break out until affliction, or some form of worry, or overwork, or disease, robbed the brain of its nerve-force. A large number of cases of that character had been reported by Dr. Crothers, of Hartford, Conn.

MENTAL DEPRESSION, WITH GENERAL TIMIDITY.

In disease as in health, fear was one of the symptoms of weakness. The nervously exhausted man was always physically insolvent and unequal to efforts that required much vital expenditure. Senseless timidity was one of the diagnostic features of that form of nervous exhaustion known as sexual exhaustion.

MORBID FEAR OF SPECIAL KINDS (*Agoraphobia*).

Fear of leaving home, of going out of the house, of going anywhere alone, etc. It was a ludicrous and absurd symptom, but it might occur in persons of intelligence, ability, and good sense.

It was analogous, in some respects, to the utter helplessness that some experienced when standing on an elevation; the will was put to rout completely, and could not rally at the call of reason. In some instances, though not in all, the strange symptom seemed to be traceable directly to sexual excess of some kind.

SICK HEADACHE AND VARIOUS FORMS OF HEAD PAINS.

Sick headache was regarded as both a symptom and a safety-valve. If we must be nervous, an occasional attack of sick headache, if it was not too severe, was an excellent way for such nervousness to manifest itself, and, no doubt, saved the person from other and worse affections.

PAIN AND HEAVINESS IN THE BACK OF THE HEAD, AND ON THE VERTEX AND THROUGH THE WHOLE HEAD,

was a common attendant upon the neurasthenic state, especially when the brain was congested. It might appear, however, when there was no evidence whatever of an excess of blood in the brain. For a number of years Dr. Beard had contended that circulation was a result of innervation; a brain or spinal cord impoverished of nerve-force was unable to maintain the balance of the ebb and flow of the arteries and the veins; consequently, anæmias and congestions arose that might be transient, or more or less permanent. But the disease was not the anæmia nor the hyperæmia (although both anæmia and hyperæmia, when they occurred, might and did induce certain symptoms peculiar to themselves), but the neurasthenia—the nervous exhaustion—the decline in the quantity and quality of nerve-force that presided over the circulation—al-

though it could not, like the blood, be weighed, measured, analyzed, or studied under the microscope.

DISTURBANCES OF THE NERVES AND ORGANS OF SPECIAL SENSE.

Nervous exhaustion produced temporary dilatation or contraction of the pupils; gave rise to the irritable eye, which was sometimes exceedingly painful and obstinate; and yet no lesion could be detected by any of the tests of modern ophthalmology.

This form of asthenopia, under various names, was coming into recognition among ophthalmologists. The eyes were painful and tender on pressure, and reading or writing or sewing was sometimes accomplished only with great pain. An attack of that kind might last half an hour, or three hours, or three months, and it might come and go suddenly. This malady, although most common among women, was found in both sexes.

SUBJECTIVE ODORS OF VARIOUS KINDS, AS OF OZONE OR PHOSPHORUS; ALSO ABNORMAL SUBJECTIVE TASTES, AS BITTER OR SOUR,

were likewise fleeting symptoms of cerebral exhaustion.

PARTIAL FAILURE IN MEMORY—SEMINAL EMISSIONS IN MARRIED MEN—LOCALIZED PERIPHERAL NUMBNESS AND HYPERÆSTHESIA—CRAWLING OR CREEPING, AS OF INSECTS JUST BENEATH THE SKIN; A SENSATION AS THOUGH A PIN OR MANY PINS WERE JUST TOUCHED TO THE SKIN; TENDENCY FOR THE LEGS AND ARMS TO GO TO SLEEP UNDER FAR SLIGHTER PRESSURE THAN IN THE NORMAL STATE OF HEALTH,

were regarded as special symptoms of nervous exhaustion.

GENERAL AND LOCAL CHILLS AND FLASHES OF HEAT.

A case was mentioned in which the knees of the patient were literally as cold as ice.

LOCAL SPASMS OF MUSCLES.

What were known as fibrillary contractions, sometimes seen in cases of progressive muscular atrophy, were also noticed in the various shades of nervous exhaustion.

The stomach in nervous dyspepsia might be the seat of similar spasms, which might follow any excitement or emotion, as of fear or responsibility. A sensation like that of a reverse aura seemed to go down to the pit of the stomach from the nerve-centres, and excited spasms apparently of the muscles of the stomach itself.

GENERAL AND LOCAL ITCHING.

In certain nervous states the itching became an element of positive distress.

ABNORMALITIES OF THE SECRETIONS.

In nervous exhaustion the *eyes* became moistened more readily than in health, and under a very slight emotion either of pleasure or of pain.

The *sebaceous glands* in nervous debility might refuse to do their duty, and the hair and the beard become dry and stiff. The hair also fell off or became gray in patches. Dryness of the skin, as well as excessive or morbid perspiration in the axillæ, or on the hands or feet, or other parts of the body. The *spermatic secretion* might also become suppressed. Obstinate constipation, in consequence of suppressed intestinal secretion.

TENDERNESS OF THE TEETH AND GUMS—VAGUE PAINS AND FLYING NEURALGIAS—FLUSHING AND FIDGETINESS.

The latter was sometimes unspeakably distressing, although it cannot be defined.

TREMULOUS AND VARIABLE PULSE, AND OCCASIONALLY PALPITATION—SUDDEN GIVING WAY OF GENERAL OR SPECIAL FUNCTIONS.

The neurasthenic patient could not trust himself a half-hour or even a moment in advance. Even in the midst of any task, mental or muscular, his strength gave out as suddenly as if he were struck by lightning.

A FEELING OF PROFOUND EXHAUSTION UNACCOMPANIED BY POSITIVE PAIN—SPECIAL IDIOSYNCRASIES WITH REGARD TO FOOD, MEDICINE AND EXTERNAL IRRITANTS.

Opium, for example, was liable to aggravate the insomnia of neurasthenic patients. Alcohol agreed with some and disagreed with others, and in a remarkable manner. Coffee frequently acted badly with these cases. Special idiosyncrasies were so frequent that, were it not for the bromides, cannabis indica, and electricity, we should be utterly disarmed in the presence of such cases.

Dr. Beard closed his paper with the following suggestions:

First.—The above symptoms were not imaginative, but real; not trifling, but serious, although not usually dangerous. Strictly speaking, nothing in disease could be imaginary. If a pain was brought on by worrying or by dwelling upon one's own condition, it was as real as though it were brought on by any objective influence.

Second.—Symptoms of nervous exhaustion were in a measure antagonistic to each other; and nervous exhaustion was itself antagonistic to many other diseases, especially of the acute and inflammatory kind. Diseases prevented diseases, diseases cured diseases, and diseases were antidotes to diseases. Sufferers from chronic neurasthenia were safer in the midst of epidemics than others were, etc.

Third.—Nervous exhaustion was a modern and preeminently an American disease.

Fourth.—The treatment of nervous exhaustion should be in general of a sedative and tonic character, and should be applied to the whole condition of the patient and not to any one of the special symptoms. Electricity in central and general applications, passive exercise, mild active exercise, perhaps absolute rest in bed, judicious use of counter-irritation, fats, fish, and phosphates, small doses of cannabis indica, the bromides, calabar bean, gelsemium, caffein, malt, oil, hydrobromic acid, were suggested as remedies. By the careful study of individual idiosyncrasies and the proper combination of remedial measures with hygienic, the majority of cases of neurasthenia could be relieved permanently, if not substantially cured.

The paper was discussed by Drs. Hubbard, H. Smith, and Weeks. The Academy then adjourned.

Stated Meeting, April 18, 1878.

DR. S. S. PURPLE, PRESIDENT, IN THE CHAIR.

SUPRA CONDYLOID AMPUTATION OF THE THIGH.

DR. J. W. S. GOULEY read a brief but interesting paper upon the above subject, which will be published in a future number of THE RECORD.

INTRA-VENOUS INJECTION OF MILK AS A SUBSTITUTE FOR TRANSFUSION OF BLOOD—WITH CASES.

Dr. T. Gaillard Thomas read a valuable paper upon the above subject, in which reference was first made to the origin, the history, and the present status of the operation of transfusion of blood.

Its occasional adoption as a therapeutical resource had been mentioned in Hebraic, Egyptian and Syriac literature.

It was not, however, until the year 1665 that it was placed upon a scientific basis as a surgical procedure, and since that date it had been an established operation.

To the question, "What is the real status of this resource in medicine?" Dr. Thomas gave the following answer: "Transfusion of blood into the human system is an operation the plausibility and theoretical advantages of which all admit, but practically the results of the operation amount to but very little indeed."

The insecure position which the operation occupied practically, was due largely to its inherent difficulties and dangers, nearly all of which arose from the tendency of the blood to coagulate. To overcome those difficulties and dangers various methods of preparing the blood for intra-venous injection had been suggested, and other fluids had also been offered as a substitute.

The object of the paper was to prove that in the milk of the cow we had a fluid which met all the theoretical and practical requirements of a safe intra-venous injection.

It might be said that milk and blood were not homogeneous fluids, and that the casein and other constituents of the milk, when introduced directly into the circulation, would be liable to give rise to disastrous results. But Dr. Thomas maintained that there was not much more want of homogeneity between blood and milk than existed between chyle and blood. The introduction of chyle into the blood was merely a part of a physiological process, and the injection of milk into the circulation was not altogether unlike copying one of nature's physiological processes.

Dr. Thomas then compared the chemical analyses of chyle and milk.

The doctor then proceeded to the relation of cases in which he had resorted to intra-venous injections of milk as a substitute for transfusion of blood.

The first was a lady from Oswego, N. Y., who resided temporarily in Brooklyn, N. Y. She was operated upon by Dr. Thomas for the removal of a large abdominal tumor in October, 1875. The case, in all its details, had already been published. Because of the severe loss of blood subsequent to the operation, and the general condition of the patient, it was resolved to resort to intra-venous injections of some restorative fluid, and Dr. Thomas decided to employ for that purpose perfectly pure fresh milk.

The suggestion of using intra-venous injections of milk was made by Dr. E. M. Hodder, of Toronto, Canada, who, twenty-eight years ago, employed it in the treatment of collapse in cases of Asiatic cholera.

The suggestion was revived by Dr. J. W. Howe, of New York, who, about one year previous to Dr. Thomas' first operation, had injected ʒ vi. of goat's milk into the cephalic vein of a patient suffering from phthisis.

Accordingly a healthy cow was driven into the yard, and ʒ viiiss. of milk drawn from her udder into a porcelain dish surrounded with warm water, was permitted to flow slowly into the median basilic vein of the patient from a glass funnel to which was attached a rubber tube and a suitable nozzle to be introduced into the opening in the blood-vessel.

A rigor followed the operation; the temperature rose to 104° F.; but those symptoms soon passed away. On the twenty-first day after the operation, the lady was able to walk down stairs, and recovery was soon so complete that she was able to return to her home in Oswego.

Soon after, Dr. J. W. Howe made some experiments upon dogs. Into the veins of *five* animals he injected milk, and all died promptly.

Dr. Eugene Dupuy, at Dr. Thomas' request, repeated Dr. Howe's experiments, when it was found that intra-venous injections of milk which had been removed from the cow for a very short time uniformly proved fatal, while the injection of *perfectly fresh* milk was entirely innocuous. Those experiments revealed the secret of failure in Dr. Howe's experiments. The milk which he had employed had been drawn from the cow an hour or two previous to the time it was used, and had been transferred to the city in a railroad car. It had probably undergone chemical change before it was used in the experiment.

The *second* case reported by Dr. Thomas was operated upon for ovariotomy, Feb. 8, 1878.

Extensive adhesions were encountered in the operation. Peritonitis and abscess followed, and the condition of the patient became so grave that, on the twentieth day after the operation, it was determined to resort to intra-venous injections of milk. A cow was secured, and the milk, drawn into a pitcher covered with carbolized gauze, was, in less than one minute from the time it was taken, flowing slowly into the vein of the patient.

On the first of March a second injection was made, and ʒ xv. of milk, taken in the manner referred to, was allowed to flow slowly into the vein. The injections were repeated March 2d, 4th, and 5th, and twelve, six, and eight ounces of milk respectively used.

The patient received in all five injections; *two* administered by Dr. Thomas and *three* given by Dr. Hunter, but the case terminated fatally. The result, however, could not be used as an argument against the operation, because, when the first injection was made, the patient was fairly moribund. At each subsequent operation it was the unanimous opinion of all who saw the patient that death was inevitable within a very brief space of time. It was thought that the patient's life was *prolonged* at least six days by the five intra-venous injections of milk. At autopsy there was found localized gangrene of the intestines, which proved that the case must have inevitably terminated fatally.

The *third* case reported simply proved that milk injected into the circulation was innocuous.

There were twelve cases upon record in which intra-venous injections of milk had been employed in the human subject: three by Hodder; two by Howe; and seven by Thomas.

The conclusions reached by Dr. Thomas were embraced in the following propositions:

1. Injection of milk into the circulation in place of blood was a perfectly feasible, safe, and legitimate procedure.

2. In this procedure none but healthy milk, drawn from the udder of the cow within a few minutes of its introduction into the vein, should be employed.

3. A glass funnel, with a rubber tube and a suitable pipe attached, was much better and safer than a more elaborate apparatus.

4. Intra-venous injection of milk was an infinitely

easier operation to perform than transfusion of blood.

5. Intra-venous injection of milk, like that of blood, was commonly followed by a chill and rapid rise in temperature, but those symptoms soon subsided and were replaced by a great improvement in the general condition of the patient.

6. He would not limit lacteal injections to cases in which profuse and exhausting hemorrhage had occurred, but recommend their use in certain cases of typhoid fever, pneumonia, cholera, etc. In conclusion it was suggested that if milk answered only nearly as good a purpose as blood for intra-venous injection, its use would create a most interesting and new era in the therapeutical department of medicine.

The paper being before the Academy for discussion—

Dr. Hutchinson, of Brooklyn, upon invitation, remarked that, although he had not had any experience with reference to intra-venous injections of milk, he had had some experience in the use of other fluids that might not be uninteresting to relate. During the cholera epidemic which occurred in New York and Brooklyn, in 1853, he resorted to intra-venous injection in five cases of collapse from that disease. In two cases the fluid used consisted of ʒ iv. of the chloride of sodium, ʒ ii. of alcohol, and Oij. of water. The two pints were used at a single operation.

In three cases a fluid was employed which was supposed to be very nearly like the serum of the blood. It was composed of grs. lx. of chloride of sodium, grs. vi. of chloride of potassium, grs. iij. of chlorate of soda, and grs. xx. of carbonate of soda. Of such a salt, 140 grains were dissolved in *forty* ounces of water, and nearly the entire quantity injected into a vein. The apparatus employed was very similar to that used by Dr. Thomas, and the fluid was kept at a temperature of 100° F. All the patients died. The effect produced by the intra-venous injections was very marked. The patients were aroused from their profound lethargy, color returned to the surface, perspiration ceased, the pulse reappeared, the intelligence was awakened, and in every case there seemed to be good prospect of recovery. In each case, however, death occurred within twenty-four hours. In one case the injection was repeated.

Dr. Hutchinson was not able to resist the conviction that, when a proper fluid was obtained, when we knew the quantity to be used, and the rapidity with which it should be injected, most valuable therapeutical results could be obtained.

Dr. A. Jacobi remarked that the report which Dr. Hutchinson had made with reference to intra-venous injections of saline solutions, agreed with those made by other observers—namely—that the patients invariably revived, but afterwards died. Modern experiments with saline solutions and serum had demonstrated why such results followed. It was because the saline injection, no matter how formed, was at at once eliminated.

There was one point upon which Dr. Thomas had not dwelt, and to which he would make allusion. Dr. Thomas had referred in general terms to the poisonous character of milk which was an hour or two old. Naturally, we would not expect that any chemical change existed in cow's milk immediately after its removal. But there were a certain number of cows in which the milk had an acid reaction even when in the udder. A large number of specimens of milk were neutral, and turned acid very quickly after removal. But whether neutral, or acid, or alkaline, depended to a great extent upon the food which the animal had taken.

It was necessary that cows should feed in pasture in order that the milk should be naturally alkaline. Milk to be introduced into the blood must be alkaline, for the blood did not at all tolerate the presence of acids. It was that fact probably that gave explanation to the ill effects produced in Dr. Howe's experiment, and the absence of ill effects in Dr. Dupuy's experiments. The question then suggested, itself would it not be well in every case, before the milk was used, to test it with litmus-paper, and if it be acid, to make it alkaline by the addition of carbonate of soda? Cow's milk, when introduced into the blood, should be a little more alkaline than it was naturally.

Again, it would, perhaps, be well to warn operators against injecting too large quantity at a single operation.

Dr. Thomas remarked that the point last referred to by Dr. Jacobi had been illustrated in the case in which five injections were given.

From six to eight ounces was probably about a reasonable quantity; eight was probably the maximum, and five the minimum quantity to be used at a single operation.

The Academy then adjourned.

Correspondence.

THE TREATMENT OF ABORTION.

To the Editor of The Medical Record.

Dear Sir:—Under the above title Dr. H. C. May, of Corning, N. Y., sends an interesting correspondence (The Medical Record, April 20, 1878), in which he reviews a late lecture by Prof. Dr. Penrose, of Philadelphia, dissents from the treatment therein recommended, and gives a typical illustration of his own treatment of this class of cases. It should not be forgotten that the report of one case, or even of several, is but the report of individual experience in the treatment of individual cases, and in most instances does not form a safe basis for scientific deductions. If there were fixed rules regarding the management of cases of abortion, the services of the obstetrician could be dispensed with, and their mechanical application trusted to nurses or an ingenious next-door neighbor. But such is not the fact, and it may be said, without incurring the risk of being rash, that scarcely any two cases occur which, from beginning to end, can be properly managed in exactly the same way.

To illustrate the plausibility of another plan of treatment, I will refer to a case almost identical in character with the one reported by Dr. May, and in which the result was equally satisfactory with that obtained by tamponing the vagina and administering ergot. Before giving the history of my case, however, I will say that tamponing the vagina under certain circumstances, in connection with abortion, is a plan of treatment which merits approval. I was summoned to go in great haste to see Mrs. H., æt. 38 years, an American, and the mother of six children. The messenger was a son of the patient, and said that his mother was "dying." I went in "obstetric haste," although the nature of the lady's sickness was a mere suspicion. When I had reached her bedside, I was immediately informed that she had been, and was then, suffering from profuse hemorrhage from the vagina. A glance at her face, a touch of the

pulse, and the saturated bed sustained the statement, and, without waiting to address my patient with reference to the last asteroid which had been discovered, I at once passed my finger into the vagina, at the same time making firm pressure over the middle hypogastrium, passed through the clots, found a placenta projecting from the mouth of the uterus, hooked my finger into it, and withdrew the mass, clots and all. The whole operation occupied probably one minute. The finger was immediately reintroduced into the vagina, the os touched, and found firmly closed. The hemorrhage had ceased. While attending to the patient, I had directed the husband to prepare a "whiskey sling." It was prepared as by the hand of an expert, and a few teaspoonful doses, associated with a moderate dose of opium, removed the faintness, revived the pulse, and elevated my patient into a very comfortable condition. I remained an hour, the favorable condition continued, and I returned home. On visiting my patient the next morning, I found her with a moderately full pulse, temperature slightly elevated, but no symptoms were present which gave rise to any anxiety. Her recovery was rapid and complete.

I did not tampon the vagina, I did not administer ergot, my patient did not vomit, and I was not compelled to remain by her bedside "three hours," and resort to various remedies for the purpose of overcoming "the deadly nausea and depression." Yet I do not mean to say but that in my next case of abortion I tamponed the vagina, administered ergot, and found the placenta in the vagina within twenty-four hours.

At my first visit I learned that pregnancy had not been suspected, for the reason that, although one menstrual period had been passed over about three months previously, she had been "unwell" twice since, and at the time in the month when menstruation usually occurred. The hemorrhage appeared quite suddenly, without definite known cause, and the discharge of the placenta convinced the woman that pregnancy had existed. It is not my purpose in this letter to disapprove of the plan of treatment adopted in Dr. May's case, but simply to report a case which terminated equally as favorably under another plan of treatment, which the doctor perhaps would not regard as "a more conservative and therefore a more excellent way." WESLEY M. CARPENTER, M.D.

210 E. 30TH ST., NEW YORK.

THE AMERICAN APPARATUS.*

TO THE EDITOR OF THE MEDICAL RECORD.

DEAR SIR:—Dr. Van Buren, in his admirable résumé contained in a recent number, of the authorship of what I had suggested might be called "The American Apparatus," questions the propriety of the suggestion, and I think with some force. Certainly it was not my intention to convey the idea that there was no other employed by good American surgeons; but as I could not retain for it the name of "Buck's" apparatus without doing apparent injustice to others who had contributed so much to its perfection, and, as at present employed, it differs considerably from that described by Dr. Buck, a change of name was thought to be necessary to avoid misapprehension. Most, if not all, who had contributed materially to its completion, were Americans. I therefore suggested "The American Apparatus," much as I would speak of "The New York Hotel," which would not necessarily imply that there was no other hotel in New York. It was simply that the apparatus might have a name which would in itself distinguish it from other forms of apparatus. If, however, it should lead any one at home or abroad to think that the ingenious and excellent apparatus devised by Dr. Nathan Smith, or that the still more ingenious and useful apparatus devised by Dr. Hodgen, of St. Louis, were not used by American surgeons, I would prefer to retain the old and familiar name of "Buck's Extension," and especially because, if he did not devise the apparatus as it is now generally used by us, he at least did more than any other man, by his publications and by the influence of his great name, to popularize the essential principles embodied in its construction.

Very truly yours,

FRANK H. HAMILTON.

* The above letter was received some time since, but its publication has been accidentally delayed.—ED.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from April 14 to April 20, 1878.

RANDOLPH, J. F., Major and Surgeon. Relieved from duty at Fort Trumbull, Conn., and to proceed to Philadelphia, Pa. S. O. 66, Department of the East, April 16, 1878.

IRWIN, B. J. D., Major and Surgeon. Relieved from duty at U. S. Military Academy, West Point, N. Y., August 28, 1878, and then to report by letter to the Surgeon-General. S. O. 79, A. G. O., April 13, 1878.

ALEXANDER, C. T., Major and Surgeon. To report in person to the Commanding General, Dept. of West Point, for duty at the Military Academy, August 28, 1878. S. O. 79, C. S., A. G. O.

WATERS, W. E., Capt. and Asst. Surgeon. Assigned to duty as Post Surgeon at Fort Clark, Texas. S. O. 77, Dept. of Texas, April 10, 1778.

MIDDLETON, P., Capt. and Asst. Surgeon. Relieved from duty at Fort Clark, Texas. S. O. 80, Dept. of Texas, April 13, 1878.

POPE, B. F., Capt. and Asst. Surgeon. Relieved from duty at Fort Stockton, Texas. S. O. 80, C. S., Dept. of Texas.

STYER, CHAS., Capt. and Asst. Surgeon. Relieved from duty in Dept. of the East, ordered to Philadelphia, Pa., and, on arrival, to report by letter to the Surgeon-General. S. O. 81, A. G. O., April 16, 1878.

Medical Items and News.

CONTAGIOUS DISEASES — WEEKLY STATEMENT.—Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending April 20, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.
April 13, 1878...	0	9	79	8	89	38	0
April 20, 1878...	0	5	115	1	130*	68	0

ARKANSAS STATE MEDICAL SOCIETY.—The Third Annual Session of this Society will be held in Fort Smith, Wednesday, May 1, 1878.

* Thirty-three cases of measles were reported from the Nursery and Child's Hospital.

CONGRESS OF GERMAN SURGEONS.—The Seventh Congress of German Surgeons was held at Berlin, April 10th to 13th.

DR. BENJ. BRODIE, of Detroit, was recently presented with an elegant edition of Holmes' Surgery from the Wayne Co. Society.

LONDON PATHOLOGICAL SOCIETY.—There are a few vacancies for honorary membership in this body which are to be filled by eminent men from other countries. A few of such can be found in this village.

TENNESSEE STATE MEDICAL SOCIETY.—The annual meeting of this Society was held at Memphis, Tenn., April 3d and 4th. Dr. R. H. Evans, of Shelbyville, was elected President, and Dr. J. Berrien Lindsley, of Nashville, Secretary.

CHLORAL HYDRATE AS AN ANTISEPTIC.—Pof. Dunster (*Michigan Medical News*) calls attention to chloral hydrate as an invaluable local anodyne and antiseptic in cases of uterine cancer. He uses it in the strength of 10 to 30 grains to the ounce.

THE IOWA CATLIN is the name of a monthly medical journal published in Osceola, Iowa. The first number appears April, 1878, and contains forty octavo pages, in which are some excellent selections. Dr. Edward Lawrence is the editor, and judging from his first effort in the present number is abundantly able to fill his chair.

DISPENSARY TICKETS.—The giving of dispensary tickets by subscribers to these institutions in Ireland is so much abused that it is proposed either to render liable for professional fees those who give the tickets to unworthy persons, or to deprive them of the opportunity of signing tickets in the future.

STATISTICS OF OPERATIONS FOR STONE.—At a recent meeting of the Royal Medical Society, London, Sir Henry Thompson read a summary of his experience in operations for stone in the bladder of the male adult, embracing in all five hundred cases, and exhibited calculi from each case. Small phosphatic concretions, though removed by lithotrity, were not regarded in the *résumé*. Of the 500 exhibited 313 were uric acid calculi; 99 phosphatic; 81 mixed; one was a case of cystic oxide; two were pure phosphate and carbonate of lime, and four were phosphatic, formed on foreign bodies. The mortality, accepting death within six weeks as due to the operation, was 32 in 422 cases of lithotrity, and 29 in 78 cases of lithotomy; total, 61 deaths in 500 operations. When calculi are so large as to require the fenestrated instrument, Sir Henry thinks lithotomy should be performed; when less, lithotrity. Mr. Cadge related 220 operations, of which 134 were by lithotomy, and 86 by lithotrity. Of the former 20 per cent. died; of the latter 10 per cent.

ST. MARY'S FREE HOSPITAL FOR CHILDREN.—Arrangements are in progress by which, according to the eighth annual report of the Sisters of St. Mary, a seaside cottage will be put in operation this summer for the benefit of convalescent children. It is also proposed to erect the new hospital building, planned by Mr. Henry M. Congdon, the front elevation of which is shown in the report, as soon as the funds can be raised by subscription, but the managers have decided not to commence until the work can be prosecuted to the end without interruption from pecuniary stress. The hospital now occupies a refitted dwelling-house at 407 W. Thirty-fourth Street, but has, notwithstanding its limited facilities, received eighty patients during the year, which, with the twenty-five under treatment when the year opened, gives an aggregate of one hundred and five. Forty-four cures, nineteen materially benefited; ten deaths, six not treated, and twenty-six in hospital January 1, 1878, complete the brief statistics of the institution. Nine operations have been performed, of which four were exsection of the hip-joint.

TREATMENT OF TETANUS.—Dr. Jackson, late Presidency surgeon at Calcutta, is cited in an article in the *Lancet*, upon the treatment of lockjaw (tetanic spasm), as having in a pamphlet, published as early as 1856, rejected the usual treatment of ice to the spine, with opium and camphor, as productive of no beneficial results in the majority of instances. "I have," says the Calcutta practitioner, "found cannabis indica and aloes decidedly more valuable, and have sometimes used anæsthetics with great benefit; but it was not until I had commenced to use the latter in combination with the former, supporting the patient with a good diet, quinine, and wine, and insisting upon perfect rest, that I met with anything like uniform success." Dr. A. P. Boon, of St. Kitts, W. I., records five cases, three of them traumatic and two idiopathic, which terminated in recovery, under a combined anæsthetic and cannabis indica treatment, care being taken as to the exclusion of light, drafts of air and all distracting noises, and stimulants being freely administered. As the fatal termination is contingent upon apnœa, Dr. Boon recommends that artificial respiration should be commenced at once upon the apparent supervention of death, and persevered in until suscitation is evidently hopeless. Dr. Watson Paul reports in the same issue a case treated successfully with combined anæsthetics and atropia.

SHORT-SIGHTEDNESS IN DIFFERENT COUNTRIES.—In the course of a careful review of Dr. Loring's communication, printed in the Transactions of the recent International Medical Congress, at Philadelphia, Dr. A. H. Jacob, formerly Ophthalmic Surgeon to the City of Dublin Hospital, arrives at the conclusion that the progress of short-sightedness in the three countries, Germany, Russia, and the United States, presents points of such radical difference as to render a comparison between them of the utmost importance. In the two former, there is a noticeable decrease in the percentage of hypermetropes between the ages of 6 and 21, the hypermetropia rapidly disappearing in Russian and German eyes between the ages specified. The loss is the more frequent in Russia, in the proportion of 31 to 9. In the United States, on the other hand, the percentage of hypermetropes constantly increases during the same period. Myopia, however, develops itself in all countries at about the same age, to wit, commencing at 6 and making gradual progress during the years of school attendance. Dr. Jacob coincides with Erismann, Max Conrad, Derby, and Agnew, in giving the percentage of short-sighted persons (myopes) as considerably larger in Germany than elsewhere. In Russia it is stated as 39.2 per 100 between the ages of 6 and 21; in Germany, 51.0, or a little more than half of the whole number; in the United States, 23.24, or a little less than one-fourth. In Russia and Germany the majority of eyes are hypermetropic until the age of 13, when they become normal or emmetropic. From that age the number of myopes constantly advances. In this country, on the other hand, the majority are normal in the first instance, and remain so until 21 years of age; while of those in which myopia occurs at all, the hypermetropia is not corrected until 17 years old, when the vision becomes normal for a short time, and then passes gradually into short-sightedness.

TO ADVERTISERS.—Permit us to direct your attention to "THE MEDICAL RECORD." It has now been published over twelve years, and has become the most popular and most extensively read of any medical journal in America. Its circulation is widespread over the entire continent—probably there are few of the active, intelligent members of the Profession who are not among its regular readers. The value to Advertisers of this large list of subscribers has long been recognized, as practically shown by the great number of pages of advertisements, rendered necessary by the patronage of those who have found that **IT PAYS TO ADVERTISE IN THE MEDICAL RECORD.**

Recent Testimony of Experienced Medical Advertisers who have Tried it.

GENTLEMEN:—Having advertised for a term of about two years in THE MEDICAL RECORD, I cheerfully express to you my appreciation of its value. Its high professional standing entitles it to the first place as an advertising medium, and the results I have obtained for all my goods through it, verify this. I likewise consider its rates, in proportion of the number of copies which it distributes to the best class of the medical profession, as cheaper by far than most all the so-called, low-priced papers.
NEW YORK, *January* 30, 1878. Very truly yours, F. ALFRED REICHARDT, Pharmacist.

GENTLEMEN:—We are entirely satisfied with the results of advertising in THE MEDICAL RECORD. There is no better medium for reaching the medical profession in the United States.
FREMONT, OHIO, *February* 10, 1878. Very Respectfully, TROMMER EXTRACT OF MALT CO.

GENTLEMEN:—The results obtained by our advertising in THE MEDICAL RECORD have been very satisfactory, and we cheerfully recommend it as being one of the best mediums for reaching physicians.
NEW YORK, *January* 31, 1878. Yours truly, W. H. SCHIEFFELIN & CO.

GENTLEMEN:—We are well satisfied with our advertisements in your MEDICAL RECORD, which have extended over a number of years. We believe the RECORD to be very ably edited, and its large subscription list of physicians is well merited. Yours respectfully, MCKESSON & ROBBINS.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—We are happy to state that we consider the RECORD one of the very best mediums for reaching the medical profession. We are yours truly, E. FOUGERA & CO.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—We regard THE MEDICAL RECORD as the *best* journal for reaching the medical profession that we know of. Yours truly, KEASBEY & MATTISON.
PHILADELPHIA, *February* 5, 1878.

GENTLEMEN:—We consider THE MEDICAL RECORD the best medium for reaching the medical profession of this country. Yours respectfully, CASWELL, HAZARD & CO.
NEW YORK, *January* 28, 1878.

In corresponding with Advertisers please mention **The Medical Record.**

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

New York Depot, No. 58 Maiden Lane.

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for **Animal Virus**, we have established stables for its propagation upon carefully-selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly **reliable** and **pure** article, which we are prepared to furnish **fresh, daily.**

We can also furnish, to those who prefer it, **Humanized Virus**, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (postpaid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides	$1.50
5 large Ivory Points, " "	.80
Large Ivory Points, less than 5, " " each	.25
1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants, 10 small Ivory Points	1.50
1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus, if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

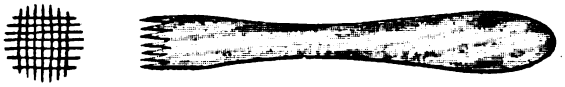
On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results obtained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish **Uncharged Ivory Points**, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1,000, $2.00
Large	per 100, 50 cents; per 1,000, 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.



Scarifying Vaccinator, Steel Nickel-Plated. See Cut. Each 25 Cents.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE,*** *and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOS. IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCH.:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ¼ grain. Dose, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

THE BEST IS THE CHEAPEST.

"IN Burr's improved Nursing Bottle all objections have been successfully overcome."

BURR'S Nursing Bottles

have been recommended and indorsed by all the leading Physicians and Druggists for the past ten years.

They are made of the very best and purest material, and by the most skilful workmen.

Nursing bottles and tubes should be thoroughly cleansed immediately after using. This is of the greatest importance, as the life of the infant depends on it.

It is almost impossible to get at the tube of the imitation Nursing Bottles in order to clean them. Carelessness in this respect is to be carefully guarded against, and the mother should look to it that this advice is followed. Restlessness, gastric irritation, griping pains and fits of screaming are the consequences of neglecting this matter, and ignorant people blame the bottle, when these results should be attributed to the carelessness of the nurse and want of cleanliness of the bottle and tubes.

In the genuine BURR'S IMPROVED NURSING BOTTLE, the nipple-holder tube-connector and mouth-guard are all ingeniously combined in one piece of hard, polished wood. It is so constructed that the nipples are very firmly held, yet they can be easily taken off for cleaning the tube and replaced in an instant.

AVOID DANGER

And all nursing bottles where the nipple-holder, mouth-guard and tube-connector are of metal, or in more than one piece.

The genuine Burr's Improved Nursing Bottles are made in eight different styles, and retail at from twenty-five to seventy-five cents.

See that the patent stamps are on the mouth-guard and stopper, and that the words "Burr's Patent Nursing Bottle" are blown in each bottle.
M. S. BURR & CO., Manufacturers, 485 Tremont St., Boston, Mass.

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,
GALVANIC BATTERIES,
BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE,

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES,** which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

This is to Certify, that I have examined Mr. L. REICH's TOKAYER AUSBRUCH, TOKAYER MASLAS, and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.

Prof. of Chemistry and Toxicology in Bellevue Hospital Med. Col., and Prof. of Chemistry and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

FOOD for INFANTS and INVALIDS

ANTILLANA.

An unmixed product from a tropical species of Canna. A light and nourishing food for Children and Invalids. Particularly adapted to Infants artificially fed, to dyspeptics and persons of weak digestion.

Pleasant to the eye and agreeable to the taste. For nursing mothers with a deficiency of milk, a bowlful taken before retiring at night will so effectually increase the secretion of milk as to save from the exhaustion consequent on the child's night nursing.

DIRECTIONS FOR USE.—As a plain food for Children and for Nursing Mothers, take a teaspoonful of the Antillana, mix into a paste with cold water, then pour over it a cupful of boiling water or boiling milk (or half milk and half water), allow it to boil for a few seconds only, and sweeten to taste. This will produce a cupful of thick, nourishing and palatable food. *See wrappers for further directions.*

Proprietor, JAMES ELMSLIE, 137 Duane Street, New York City.

PRIZE MEDAL, PARIS MARITIME EXHIBITION, 1875.

NEAVE'S FOOD

FOR

INFANTS

AND

INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and tinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ **Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.**

AGENT FOR THE STATES,

J. O. NOXON, 444 Fulton Street, Brooklyn, N. Y.

DELLUC'S BISCOTINE FOR INFANTS AND INVALIDS.

This excellent and healthy substance is prepared from a sweetened bread and other nutritious substances, reduced to a fine powder, so as to render them easily soluble in water or milk.

A similar preparation is known in France, under the name of **Biscottes** Food for Infants and Invalids.

As an article of common diet for infants, particularly those suffering from delicate constitutions, weak intestines, or looseness of the bowels, it will be found to give health and strength with more certainty than the **Crude** substances now in use, and not like them, liable to sour on the stomach.

DELLUC & CO., 635 Broadway, New York.

The attention of the medical profession is invited to this instrument as the most perfect ever invented for treating Prolapsus Uteri, or falling of the Womb. It is an Abdominal and Uterine Supporter combined.

The Abdominal Support is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen.

The Uterine Support is a cup and stem made of very highly polished hard rubber, very light and durable, shaped

to fit the mouth of the womb with openings for the secretions to pass out, and which can be sent to any curve desired, by heating in very hot water.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic, adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversion, or any Flexion of the Womb, and is used by the leading Physicians with never-failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage; or by express C. O. D.

Dr. McINTOSH'S NATURAL UTERINE SUPPORTER CO., 296 West Lake Street, Chicago, Ill.

Our valuable pamphlet, "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

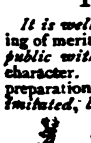
To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention, *nor been more fiercely imitated, by competition*, even to weeding and shipping order.



Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,

E. HEATON,

General Agent for the United States.

SOLD BY DRUGGISTS, AND PHARMACISTS, IN THE *PRINCIPAL CITIES OF THE UNITED STATES.*

JOHN CARLE & SONS, NEW YORK.

Dr. N. Gerber's Milk-Food

Prepared in THUN, SWITZERLAND.

Many farinaceous foods prepared for children contain too much sugar and starch, while the milk added to these foods is insufficient in quantity, so that the proportion between the azote and non-azote bodies is not fairly balanced, and consequently, the children are fed in an irrational manner.

After long experimentation, in which I have sought to avoid this serious defect, I now offer an article which I believe will meet the necessity of the case, inasmuch as it contains **less starch and sugar and more milk.**

DIRECTIONS.

For children up to three months old, one part of the "Food" to eight or ten parts **cold water.** The quantity of water may be reduced for older children to four or five parts to one of "Food." After mixing well, boil it five minutes, taking care to stir it well.

CHEMICAL ANALYSES.

The composition of Dr. N. GERBER'S "Milk-Food" is stated by well-known Chemists, as follows:

THE ANALYTICAL SANITARY INSTITUTION, LONDON, April 27, 1876.

The results of my analysis show that Dr. GERBER'S Milk-Food is composed in part of condensed milk; that it contains all the elements of a complete food, namely: the Starchy, Saccharine, Albuminous, and Mineral, in such proportions as render the food well adapted for the nutrition of infants and young children.

The amount of Nitrogenous matter and of Phosphoric Acid furnished are considerable.

The Nitrogenous matter includes 1.86 per cent of Nitrogen, and the Mineral matter 0.51 per cent of Phosphoric Acid.

ARTHUR HILL HASSALL, M.D., Chemist,
Author of "Food; its Adulterations, and the Method for their Detection."

MONTREAL, Canada, November 10, 1877.

I have satisfied myself that DR. GERBER'S Milk-Food is not a mere "Farinaceous Food," but that it really contains, as it professes to contain, the formative elements of *Flesh, Blood and Bone;* also *Carbonaceous Matter* for the maintenance of animal heat,—thus constituting a *complete diet*, formed on the basis and type of Human Milk. * * * I can conceive of no better substitute for "Mother's Milk."

J. BAKER EDWARDS, Ph.D., D.C.L.,
Professor of Chemistry Bishop's College and College of Pharmacy, Montreal, and Public Analyst for District of Montreal, under Inland Revenue Act.

HYGIENIC PHYSIOLOGICAL INSTITUTE, MUNICH, Sommer, 1877.

Repeated experiments of Dr. GERBER'S Milk-Food, made by D. Med. FR. RENK, Assistant of Privy Counsellor Prof. Dr. MAX VON PETTENKOFER, at his Laboratory; also, at Prof. Dr. C. VOIT'S Physiological Institute in Munich, show the average analysis to be:

Water,	4.31 per cent.
Mineral Salts,	2.03 "
Fats,	5 23 "
Albuminates,	15.51 "
Hydro-Carbons, soluble,	48.41 "
" " insoluble,	24.46 "
	99.95 "

This preparation is highly recommended by:

Prof. DEMME, Physician to the Jenner Hospital for Children Berne, Switzerland.

Dr. J. RUD. SCHNEIDER, Sup't of the Hospital of the Canton Berne, Switzerland.

A. M. SIGEL, M.D., Phys. to the Olga Hospital Asy. for Infants, Stuttgart.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**
"	"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nelaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receipt of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

PERFECTION SPONGE TENTS.

These Tents are the *very best in market;* in *quality of sponge, method of manufacture, strength, utility,* and *medication.*

The many complaints by the Profession against those commonly sold have encouraged the sale of the "Perfection," which will be sent in boxes of one dozen, assorted, by mail, on receipt of $2.50.

The maker holds letters of approval and recommendation from the following eminent Physicians:

J. Marion Sims, M.D., N. Y., | Washington L. Atlee, M.D., Phila.,
T. Gaillard Thomas, M.D., N.Y., | W. Byrne M.D., Brooklyn.

Address THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

QUININE, SULPHO-CARBOLATE, 1, 2, 3, and 5 grs.

This Salt of Quinine has been very much used in some of our extreme malarial districts during the past two years. Those who have tested it very carefully, claim that it possesses a most positive specific action in the treatment of fever and ague, and has proved itself eminently superior to the Sulphate of Quinine in all malarial fevers.

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

MATHIAS ROZSNYAY.

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,
Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchona Alkaloids. Quinidia, Cinchonidia, Cinchona, Quiniodin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academié de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $8.00.

CHARLES F. FOLSOM, M.D., }
HENRY P. QUINCY, M.D., *Assistant in Histology.*
EDWARD N. WHITTIER, M.D., *Assistant in Clinical Medicine.*
GEORGE M. GARLAND, M.D., *Assistant in Physiology.*

The following gentlemen will give Special Clinical Instruction:

FRANCIS B. GREENOUGH, M.D., and EDWARD WIGGLESWORTH, M.D., *in Syphilis.*
JOHN O. GREEN, M.D., and CLARENCE J. BLAKE, M.D., *in Otology.*
CHARLES P. PUTNAM, M.D., and JOSEPH P. OLIVER, M.D., *in Diseases of Children.*
SAMUEL G. WEBBER, M.D., and JAMES J. PUTNAM, M.D., *in Diseases of the Nervous System.*

Persons who hold no degree in arts or science must pass an *examination for admission* to this School, in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held June 24th, both at Boston and at Cincinnati; on September 23d, at Boston only.

Instruction is given by lectures, recitations, clinical teaching, and practical exercises, distributed throughout the academic year. The year begins Sept. 26, 1878, and ends on the last Wednesday in June, 1879. It is divided into two equal terms, either of which is more than equivalent to the former "Winter Session," as regards the amount and character of the instruction. The course of instruction has been greatly enlarged, so as to extend over three years, and has been so arranged as to carry the student progressively and systematically from one subject to another in a just and natural order. In the subjects of anatomy, histology, chemistry, and pathological anatomy, laboratory work is largely substituted for, or added to, the usual methods of instruction.

Instead of the customary oral examination for the degree of Doctor of Medicine, at the end of the three years' period of study, a series of written examinations on all the main subjects of medical instruction is held at the end of each year; and every candidate for the degree must pass a satisfactory examination in every one of the principal departments of medical instruction during his period of study.

DIVISION OF STUDIES.

For the First Year.—Anatomy, Physiology, and General Chemistry.

For the Second Year.—Medical Chemistry, Materia Medica, Pathological Anatomy, Clinical Medicine, Surgery, and Clinical Surgery.

For the Third Year.—Therapeutics, Obstetrics, Theory and Practice of Medicine, Clinical Medicine, Surgery, and Clinical Surgery.

Students are divided into three classes, according to their time of study and proficiency. Students who began their professional studies elsewhere may be admitted to advanced standing; but all persons who apply for admission to the second or third year's class must pass an examination in the branches already pursued by the class to which they seek admission. The examinations are held in the following order:—

At the end of the first year—Anatomy, Physiology, and General Chemistry.

End of second year—Medical Chemistry, Materia Medica, and Pathological Anatomy.

End of third year—Therapeutics, Obstetrics, Theory and Practice of Medicine, Clinical Medicine, Surgery, and Clinical Surgery.

Examinations are also held before the opening of the School, beginning September 23d.

REQUIREMENTS FOR A DEGREE.—Every candidate must be twenty-one years of age; must have studied medicine three full years, have spent at least one continuous year at this School, have passed the required examinations, and have presented a thesis.

COURSE FOR GRADUATES.—For the purpose of affording to those already Graduates of Medicine additional facilities for pursuing clinical, laboratory, and other studies, in such subjects as may specially interest them, the Faculty has established a course which comprises the following branches: Histology; Physiology; Medical Chemistry; Pathological Anatomy; Surgery; Auscultation, Percussion, and Laryngoscopy; Ophthalmogy; Dermatology; Syphilis; Psychological Medicine; Otology; Electro-therapeutics; Gynæcology; and Obstetrics. On payment of the full fee the privilege of attending any of the other exercises of the Medical School, the use of the laboratories and library, and all other rights accorded by the University will be granted. Single branches may also be pursued. Graduates of other Medical Schools who may desire to obtain the degree of M.D. at this University will be admitted to examination for this degree after a year's study in the Graduates' Course. Examination on entrance not required.

FEES.—For Matriculation, $5; for the Year, $200; for one term alone, $120; for graduation, $30. For Graduates' Course, the fee for one year is $200; for one Term, $120; and for single courses such fees as are specified in the Catalogue. Payment in advance.

Members of any one department of Harvard University have a right to attend lectures and recitations in any other department without paying additional fees.

For further information, or Catalogue, address

DR. R. H. FITZ, *Secretary,*

THIRTY-SIXTH SESSION.—1877-78.

FACULTY OF MEDICINE.

REV. HOWARD CROSBY, D.D.,
Chancellor of the University.
ALFRED C. POST, M.D., LL.D.,
Professor Emeritus of Clinical Surgery; President of the Faculty.
CHARLES INSLEE PARDEE, M.D.,
Prof. of Diseases of the Ear; Dean of the Faculty.

JOHN C. DRAPER, M.D., LL.D.,
Professor of Chemistry
ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine.
WILLIAM DARLING, A.M., M.D., F.R.C.S.,
Professor of Anatomy.
WILLIAM H. THOMSON, M.D.,
Professor of Materia Medica and Therapeutics.
J. W. S. ARNOLD, M.D.,
Professor of Physiology and Histology.

JOHN T. DARBY, M.D.,
Professor of Surgery.
J. WILLISTON WRIGHT, M.D.,
Professor of Obstetrics and Diseases of Women and Children.
FANEUIL D. WEISSE, M.D.,
Professor of Practical and Surgical Anatomy.
JOSEPH W. WINTER, M.D.,
Demonstrator of Anatomy.

POST-GRADUATE FACULTY.

D. B. ST. JOHN ROOSA, M.D.,
Professor of Ophthalmology.
WM. A. HAMMOND, M.D.,
Professor of Diseases of the Mind and Nervous System.
STEPHEN SMITH, M.D.,
Professor of Orthopædic Surgery.
J. W. S. GOULEY, M.D.,
Professor of Diseases of the Genito-Urinary System.

MONTROSE A. PALLEN, M.D.,
Professor of Gynæcology.
HENRY G. PIFFARD, M.D.,
Professor of Dermatology.
A. E. MACDONALD, M.D.,
Professor of Medical Jurisprudence.
JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge*.

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofor , by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and orde as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

27 Great Jones Street, New York.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case.....$9 00
Quarts, 2 dozen in a case.....7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case.....$8 00
Quarts, 2 dozen in a case.....6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

Instruction, Retreats, Private Hospitals, &c., &c.

TO ADVERTISERS.—Cards inserted, under the above headings at the rate of 20 cents per line, column width, Nonpareil type. *No Advertisements taken for less than Ten Lines.*

TO PHYSICIANS.

A graduate of Harvard University Medical School wishes to be an assistant to, or partner with, a Physician. *Address* S. P. FOWLER, M.D.,
189 Elm Street, New York.

PHYSICIAN'S PRACTICE FOR SALE.

Physicians—rare chance—Practice of $20,000 in eight years, averaging $2,500 per annum, and splendid country home, for sale. Price, $3,200; easy terms. The property alone should bring $4,000, but wishing to retire, will sell property and practice at the very moderate sum of $3,200. Address
DR. F. W. VANDERSLOOT, Nittany, Centre Co., Pa.

ATTENTION, PHYSICIANS!

For Sale—at a nominal price—the Office Fixtures and Practice of a well-established Physician and Surgeon; worth from $2,500 to $3,000 per annum, in a pleasant town in Ohio. *Address*, A. VULNERUM,
Wooster, Ohio, Wayne County.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.
Washington Heights, New York.

DR. MUNDÉ, 20 West 45th St., New York.

SHADY LAWN,
GOTHIC STREET, NORTHAMPTON, MASS.

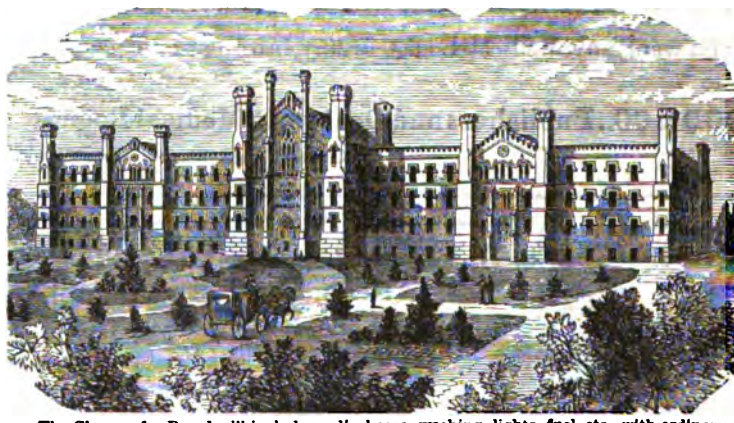
ENLARGED NOVEMBER, 1876.

A MEDICAL HOME FOR INVALIDS:

Diseases of the Mind and Nervous System;
Medical and Surgical Treatment of Ailments of Women.
The Alcohol and Opium Habits.

A. W. THOMPSON, A.M., M.D. (CANTAB.)
Formerly of Northampton Lunatic Hospital. Ex-President Hampshire Medical Society.

NEW YORK STATE INEBRIATE ASYLUM,
Binghamton, Broome County, N. Y.



This Asylum is admirably situated, overlooking a fine section of country, and is complete in all the appointments of a first-class home, with ample means to meet the wants of every case. It is located three miles from the city, and removed from all temptation. Its management is the same as all other State charities, under the control of a Board of Managers appointed by the Governor. The law provides for the maintenance of indigent inebriates, similar to that of the insane, but patients from other States may be admitted.

The experience of this Asylum, for the past ten years, indicates an increasing usefulness and necessity for such institutions, and the original intention of making this an Asylum Hospital, where this disorder may be thoroughly understood and treated on broad scientific principles is nearer realized than ever before. All rules are strictly enforced, and no patient permitted to go beyond the Asylum grounds without permission from the Superintendent, or in the care of an attendant.

The Charges for Board will include medical care, washing, lights, fuel, etc., with ordinary attention. The exigencies of each particular case will be acted upon, as it may present itself, to those of moderate and limited means as well as the rich.

All inquiries and applications for admission should be addressed to the Superintendent.

DANIEL H. KITCHEN, M.D., Superintendent,
Binghamton, Broome Co., N. Y.

WILLARD PARKER, M.D., New York, N. Y.,
President Board of Managers.

The Medical Record has the Largest Circulation of any Journal of its kind in America.

Issues over 300,000 a Year.

ITS CIRCULATION IS WELL DISTRIBUTED OVER THE NORTH, SOUTH, EAST AND WEST

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CHRONIC CONSTIPATION, HEADACHES, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

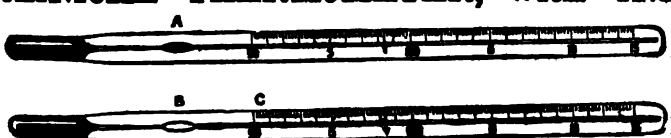
Blancard

Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

F. G. OTTO & SONS'

STEAM ATOMIZER.

A is a cylinder (made of Russian iron) for the reception of a copper-bottom boiler, C, and an Alcohol lamp, B. D is the safety-valve, E the Glass spray tube, F the medicine cup, H the face shield, I is a split tube which slides on the upright K, by means of which the face shield may be lowered or raised at will. G is a glass cup, and serves as receiver for the drippings of the face shield.

DIRECTIONS FOR USE.

Unscrew the valve D, fill the boiler to about three-quarters of its capacity with water, and screw the valve D on securely; then light the Alcohol lamp B. When sufficient steam is generated, it will pass through the horizontal part of spray tube and blow over the perpendicular part, which will then suck up the medicine from the cup F, and will produce a very fine spray.

In placing this Steam Atomiser before the profession and public, we have tried and succeeded to make a perfect and at the same time a cheap and reliable instrument.

Price, $4.00.

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material, the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's and all other shapes. *Manufactured only by*

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

NOTICE.

It will please many of our readers to know that the firm of Hegeman & Co., whose failure we noticed in January, have again resumed their business. Mr. Geo. B. Marcher, who for twenty years had charge of the wholesale and manufacturing business of the establishment, has been associated with the concern, and the business will again be carried on as before, at 203 Broadway.

Editorial "New Remedies," April Number.

HEGEMAN'S
STANDARD
PREPARATIONS.

CORDIAL ELIXIR OF CALISAYA BARK, a pleasant and agreeable Tonic for dyspepsia, etc.; for persons living in Fever and Ague districts, it will be found invaluable as a preventive.

FERRATED ELIXIR OF BARK, the most perfect Iron Tonic; a pleasant cordial, containing the active principles of Calisaya Bark and Iron.

TOLU AND LIVERWORT EXPECTORANT, a speedy and certain cure for coughs, hoarseness, and all diseases of the throat and lungs.

GENUINE MEDICINAL COD LIVER OIL, for Consumption, Scrofula, Rheumatism, etc. Our Oil has stood the test of twenty years, and thousands of patients attribute their recovery to its use. It is warranted pure.

NUTRITIVE TONIC.

BEEF, WINE AND IRON.—Our *Nutritive Tonic* is prepared from Extract of Beef, Pure Sherry Wine, and Citrate of Iron, combined with a pleasant form; and, in all cases where an efficacious Tonic is desired, it will be found a most valuable preparation. It is extensively used in all sections, and highly recommended by the most eminent physicians.

HEGEMAN'S
COD LIVER OIL AND LIME.

The name of this Compound of Medicine is undoubtedly well known to very many; in fact, the combination of the Genuine NEWFOUNDLAND Cod Liver Oil and Phosphate of Lime, as prepared by us, has a world-wide reputation as the most potent remedial agent in the treatment of that scourge of our country—Consumption—and more prevalent in our climate than any other section in the world.

We have spared neither pains nor expense in the manufacture of this preparation, and its superior quality is shown in the fact that wherever it has been introduced it has superseded all others.

CHAPPED HANDS AND FACE,

Sore Lips, Dryness of the Skin, &c., &c.,

Cured at once by HEGEMAN'S CAMPHOR ICE WITH GLYCERINE. It keeps the hands soft in all weather. See that you get HEGEMAN'S Sold by all Druggists. Price 25 cents; sent by mail for 30 cents.

Aconitia.....1-60 gr.	**Mercury, Proto-Iodide**....1-5, 1-4, 1-2 gr.
Arsenious Acid.....1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**.....1-8, 1-4 gr.
Atropia.....1-60 gr.	**Morphia, Sulphate** 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract.....1 ± gr.	**Morphia, Valerianate**..... 1-8 gr.
Calcium, Sulphide.....1-10 gr.	**Podophyllin**.....1-8, 1-4 gr.
Codeia.....1-16, 1-5 gr.	**Quinia**.....1-2, 1-4 gr.
Corrosive Sublimate....1-40, 1-30, 1-20 gr.	**Strychnia**.....1-60, 1-40, 1-30 gr.
Digitalia.....1-60 gr.	**Sulphur, Iodide**.....1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.	**Tartar Emetic**.....1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass, $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. "Successfully used for Dyspepsia, Diarrhœa and Female Complaints."—Prof. Sam'l Jackson, M.D., Univ. of Penn. "Invaluable for Neuralgia and Nervous Diseases."—Geo. T. Harrison, M.D., Woman's Hospital, N.Y. "Unequaled for diseases peculiar to females."—John P. Metteaer, M.D., LL.D., of Va. "Specific for Scrofulous and Cutaneous Affections."—J. M. Allen, M.D., of N. C. "Excellent Tonic Alterative and Diuretic—one of Nature's greatest remedies."—Medical Asso. of Va., Lynchburg. Address, **A. M. DAVIES, Prest. of the B. A. & I. S. Co., Lynchburg, Va.**

Sold by CASWELL & MASSEY, New York City.

CARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal; Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Codeia, ½ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-5 grain; Crotors Chloral (Liebreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascardium; Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ¼ grain Extr. Nux Vomica; Extr. Gilsemium; Drag. Meglin; Quin. and Ferri Citras, (20% Quina.) 2 grains; Tonic Aperient; also the already well-known Granl Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Avenue.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIG'S Investigations, published in *Edinburgh Medical Journal* for May, 1873.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

Original Lectures.

LECTURES ON THE LOCALIZATION OF SPINAL AND CEREBRAL DISEASES.*

By E. C. SEGUIN, M.D.,

CLINICAL PROFESSOR OF DISEASES OF THE MIND AND NERVOUS SYSTEM IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

Lecture II.

SYNOPSIS.—1. SYSTEMATIC LESIONS OF THE SPINAL CORD; LESIONS IN THE ÆSTHESODIC SYSTEM, LESIONS IN THE KINESODIC SYSTEM.

Gentlemen:—As a basis for our study of the diagnosis of the location of lesions in the spinal cord, I offer you the following classification, which I think embraces all that sound clinical observation and post-mortem examination will justify us in diagnosticating with certainty.

I. Systematic Lesions of the Spinal Cord.

II. Non-systematic or Focal Lesions of the Spinal Cord.

By the former we are to understand pathological changes which involve one of the gray or white columns of the cord for a part or the whole of its extent up and down, without extension to adjacent columns. Such lesions are almost always symmetrical in the two halves of the organ; and occasionally more than one such lesion may be present.

By the second form of lesion we understand a focus of disorganization or new tissue growth involving the spinal cord in a limited part vertically, and invading diverse columns, or even systems, transversely. These are the *lésions en foyer* of French authors.

The first group may be subdivided as follows:

I. Systematic Lesions of the Spinal Cord.
- *a.* Lesions in the Æsthesodic System.
  1. Sclerosis of the Columns of Goll.
  2. Sclerosis of the Columns of Burdach.
- *b.* Lesions in the Kinesodic System.
  1. Sclerosis of the Anterior Columns.
  2. Sclerosis of the Lateral Columns.
     a, with changes in Anterior Horns.
  3. Degeneration of the Postero-lateral Columns.
  4. Myelitis of the Anterior Horns.
  5. Degeneration of Ganglion Cells of Anterior Horns.
  6. Central Myelitis.

In studying the above forms of disease, I shall apply more or less rigidly the following method:

First, state the general symptoms which indicate disease in the part of the spinal cord (the system) affected. Second, accurately locate the lesion, and state the symptoms produced by it particularly. Third, say a few words concerning the disease in question.

a. Lesions in the æsthesodic system are characterized by the following symptoms: Pain, usually of a peculiar kind, hyperæsthesia, numbness, and anæsthesia; by a peculiar disorder in voluntary movements, viz.: ataxia: and, negatively, by the absence of true paralysis or spasm in the affected limbs.

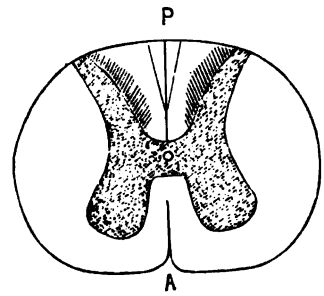
1. Sclerosis of the columns of Goll, or the posterior median columns. Whether in the ascending secondary degeneration, or idiopathically produced (one case), the lesion occupies the more or less exactly triangular space lying between the columns of Burdach. At the lowest part of the cord the lesion is hardly visible, owing to the smallness of the columns at this point, but in the cervical region it is quite large and distinct. At the calamus scriptorius the lesion disappears, and so far has not been traced higher up. In Pierret's case these columns were sclerosed throughout their whole extent. In cases of ascending secondary degeneration they are diseased only above the focus of disease.

The common lesion of the columns of Goll (secondary degeneration) gives rise, so far as we now know, to no symptoms; consequently, we can only infer its presence by determining the existence of a lesion capable of producing ascending and descending degeneration in the spinal cord.

The symptoms in the single case of idiopathic disease of these columns (Pierret's) are too uncertain and too badly reported to be of any use. They consisted in numbness, slight anæsthesia, and a tendency to retropulsion.

It is right to conclude that we cannot to-day directly diagnosticate disease limited to the columns of Goll.

2. Sclerosis of the columns of Burdach, or the posterior root-zones. The lesion begins in the outermost portion of these columns, near the inner margin of the posterior horns, and, extending forward and inward, ultimately occupies the whole of the columns of Burdach, as shown in the accompanying diagram.



The section showing this lesion, which I now pass around, was taken from the cervical enlargement of the spinal cord of a woman who had typical locomotor ataxia in the lower and upper extremities, gastric crises, diplopia, and amblyopia. In most fully developed cases of locomotor ataxia the sclerosis is found to occupy the posterior median columns as well, *i. e.*, the whole of the posterior columns are degenerated; but, since the researches of Pierret upon the functions and pathological anatomy of the posterior median columns, we must look upon changes in them as secondary to the sclerosis of the columns of Burdach.

In complicated cases of sclerosis of the posterior columns there may also be sclerosis of the lateral columns, or degenerative changes in the central and anterior gray matter.

The symptoms which are characteristic of sclerosis of the columns of Burdach are, in order of importance, pain, hyperæsthesia, anæsthesia, ataxic movements. I can only in these lectures call your attention to the great diagnostic symptoms, and must not attempt to delineate the semeiology, etc., of any disease; yet the above symptoms deserve more than a mere mention. The pains are peculiarly characteristic—nay, almost pathognomonic. They are of several varieties. First,

* Delivered at the College of Physicians and Surgeons during the months of December, 1877, and January, 1878.

sharp, lancinating cutaneous pains, appearing in spots, usually circular or oval, in size from one to two inches in diameter, in any part of the limbs which are afterward to become ataxic. A few shootings may take place in one spot, or it may be the seat of pain for twelve or twenty-four hours. A capital point is the capriciousness with which the pains appear in any and all parts of the limbs—toes, thighs, calves, shins, etc. They are vagrant or vagabond pains, in sharp contrast to the fixed *neural* pain of neuralgia. Second, deep, boring pains; and third, tearing or bruising deeper pains, affecting the articulations as well. These pains are also vagabond and capricious in their mode of appearance. They may exist for years without anæsthesia and ataxia showing themselves, and both patient and physician are apt to speak of the pains as "rheumatic," instead as of pathognomonic of an incurable disease. Hyperæsthesia accompanies and succeeds the pain, more especially in the patches of skin which are the seat of stabbing pains. During the paroxysm, and for hours afterward, the patch or patches are exquisitely sensitive, and hyperalgesia exists. Anæsthesia is said to be present very early in the disease, as well as later. In the former case it occupies patches of skin on the legs, arms, and trunk, according to the extension of the disease. In the second case it is found under the feet, later in the legs, and may involve the whole of the lower (and upper) extremities toward the close of the disease.

The ataxic walk consists in a jerky, stamping gait, the abductors and extensors acting over-forcibly; the want of co-ordination affects large muscular groups, thus differing from chorea, paralysis agitans, etc. But a somewhat similar ataxia may be present in cases of intra cranial disease, so that I would urge you to fall back upon the sensory symptoms for your diagnosis.

Many practitioners employ what they consider a sure and ready test for locomotor ataxia, viz., they bid the patient try to stand with his eyes closed. If he stagger or fall, he is said to have the disease. Now, I would have you all bear in mind that this test is worthless. Oscillating with closed eyes is a symptom common to many cerebral, spinal, and peripheral morbid states, as hysteria, myelitis, etc. I once artificially froze the soles of a patient's feet, and showed him in this amphitheatre with an excellent stagger when his eyes were closed. He staggered because his feet were anæsthetic, and that is one reason why hysterical women and the bearers of myelitis do the same. We may safely put it in this way: patients with locomotor ataxia, at a certain stage, do stagger when their eyes are closed; but, as the bearers of several other spinal diseases do the same, the sign has no special value.

For many years, and even long after the patient is absolutely unable to stand, there is almost no paresis and no diminution of reflex or of electrical excitability in the affected extremities, unless the sclerosis extend forward into the gray matter.

We ought, I think, to be able to correctly diagnosticate this lesion in its first stage, viz., when only pain and hyperæsthesia are present.

Historical Consideration.—The clinical history of locomotor ataxia has been fairly well known since 1835 or 1840; German physicians describing it in great part under the name of Tabes Dorsualis. Romberg, in 1853 (and earlier), gave almost a perfect picture of the disease; but it was reserved for Duchenne (1859–60) to recognize the value of the pains and of the ataxia, as distinguished from paresis, as cardinal symptoms. Although Duchenne's description of the affection has hardly been improved upon, it must be admitted that he knew nothing of its pathological anatomy, and was quite wrong in his explanation of the symptoms. Yet the lesion of locomotor ataxia, or tabes dorsualis, had already been discovered by Türck in 1857. Unfortunately, he buried his remarkable paper in the Transactions of the Academy of Vienna; and Gull (Sir William) independently made the same discovery in 1859. In France, Bourdon worked out the pathological anatomy in 1861, and since, our knowledge upon the point has grown enormously. The anomalies of locomotor ataxia, both semeiological and pathological, have been best studied by Charcot and his pupils. In 1873, Charcot and Pierret published their cases demonstrating that the primary essential lesion of locomotor ataxia involves the columns of Burdach.

b. Lesions in the kinesodic system are characterized by the following symptoms: paresis or paralysis, spasm, and muscular atrophy; and, negatively, by the absence of anæsthesia, or of marked and permanent pain or numbness.

1. Sclerosis of the true anterior columns or columns of Türck, or, best, the direct pyramidal fasciculi, has been known pathologically since the publication of Türck's first papers in 1851. Its semeiology is, however, unknown. We can infer its existence in those cases in which we diagnosticate lesion No. 3 (*infra*), because pathological anatomy shows us that the two lesions are usually simultaneous.

2. Sclerosis of the lateral columns. The lesion consists in an increase of the neuroglia and atrophy of nerve-fibres in the lateral masses of white substance throughout a greater part or the whole of the spinal cord. It may exist alone as a primary lesion, or may be associated with other (secondary) morbid processes, such as No. 4 (*infra*).

The symptoms consist in progressive paresis of the lower limbs, and later of the upper, with increased reflex, and a tetanoid state of the extremities. There is very little sensory disturbance, never anæsthesia: the paralyzed and tetanized muscles do not undergo atrophy; and the bladder is not in the true sense of the word paralyzed.

These symptoms have been designated by various names. Erb calls the symptom-group spastic spinal paralysis; Charcot, spasmodic tabes; and I would suggest the term tetanoid paraplegia or paralysis. Erb in 1875, and Charcot in 1876, Erb again this year, have fully described the clinical aspects of the disease.

In 1873 I described, under the title of tetanoid pseudo-paraplegia, the symptoms of the semi-developed disease, of that transition period when the patient is still able to get about upon his morbidly stiffened limbs. I failed, however, to seize upon the whole clinical picture.

The pathological anatomy of this affection does not as yet rest upon a firm basis. Türck in 1859 published three autopsies in cases of this sort, but their clinical features had not been worked out. In 1865 Charcot reported sclerosis of the lateral columns as the lesion found in a woman who had suffered from aggravated hysteria, with contractures of the extremities, for many years. In the essays of 1876–7 no other autopsies are recorded.

2 *a.* Combination of lesion of the anterior horns with sclerosis of the lateral columns. Charcot, in 1874, first called attention to this complex systematic lesion, and designated the disease as amyotrophic lateral sclerosis.

The cervical enlargement of the spinal cord being nearly always the first part affected, we observe that the symptoms appear first in the hands; a paralytic

atrophy setting in with considerable rapidity. Formication and fibrillary movements may be present. The atrophy resembles more that observed in myelitis of the anterior horns (No. 4) than in degeneration of the ganglion cells of the anterior horns (No. 5). In a short time a degree of rigidity appears in the upper extremities, and the legs become first paretic, later, rigid and contractured. This contracture may be greatly relaxed while the patient is in bed, but is exaggerated if he try to stand or walk. In consequence of great atrophy of the interossei, the "claw-hand" deformity may appear. As a rule, the muscles of the lower limbs do not waste. The bladder and rectum are not paralyzed, and no anæsthesia is observed. If the patient's life be prolonged, the disease invades the nuclei of the motor bulbar nerves, and to the above picture we have superadded the symptoms of labio-glosso-laryngeal paralysis.

Cases of this kind had been observed prior to 1874, but it is Charcot who in that year first gave us a clear statement of the pathological anatomy and semeiology of the disease. The connection between the two lesions, disease in the anterior horns, and sclerosis of the lateral columns, is by no means understood, and it may be questioned whether they are pathologically related.*

3. Degeneration of the posterior part of the lateral column, or (better) of the crossed pyramidal fasciculus. The lesion occupies, in a transverse section, a part of the white substance which lies between the lateral column and the posterior gray horn. It is separated from the periphery of the cord by healthy tissue, the direct cerebellar fasciculus. This alteration of tissue is secondary to a lesion in parts of the nervous centres above the decussation of the pyramids; in the anterior pyramids, the great motor tract in the basis cruris cerebri, the anterior part of the internal capsule, the nucleus caudatus, the convolutions comprising the excitable districts of the cerebrum. Lesions of any of these parts cause what is known as secondary degeneration throughout the motor tract, to the lowest part of the spinal cord. Consequently, the lesion in the spinal cord is always (?) on the side opposite to that on which the primary, supra-spinal disease exists. Hence, also, we usually find descending degeneration only in one-half of the cord. It should be remembered, however, that, as a portion of the anterior pyramid of the medulla does not decussate, but descends as the direct pyramidal fasciculus, or column of Türck, we must expect to find in many cases a similar lesion of this fasciculus on the same side as the supra-spinal lesion (No. 1). For example, after a lesion involving the great motor tract in the left hemisphere, we shall find descending degeneration of the crossed pyramidal fasciculus in the right half of the cord, and of the anterior column, or direct pyramidal fasciculus in its left half.

The symptom characteristic of this morbid condition is the secondary contracture, or late contracture, which so often succeeds attacks of hemiplegia, being superadded to paralysis or anæsthesia. This lesion may be complicated with No. 4, when atrophy of some of the paralyzed and rigid muscles supervenes.

In briefly mentioning the historical data connected with this lesion, I must again mention Türck, the great pioneer in the pathology of systematic lesions of the spinal cord. In 1851 and 1853 he exactly described the crossed part of the lesion. An excellent study of this and other forms of secondary degeneration was made by Bouchard in 1866, under the direction of Profs. Vulpian and Charcot. Last year Flechsig published his remarkable researches upon the nervous centres, and more exactly defined the seat of both the crossed and the direct degenerations. To Prof. Bouchard is due the credit of completing the clinical picture, by pointing out the value of the symptom contracture.

* Since this lecture was delivered, Prof. Flechsig, of Leipzig (in *Archiv der Heilkunde*, 1878, Heft 1), has made an elaborate critique of Charcot's cases and others, and claims that the lesion in the lateral columns is chiefly in the postero-lateral columns, as in descending degeneration from cerebral lesion, and that the nature of the lesion seems more like a degenerative than a sclerotic one. Flechsig suggests that future research may reveal a double lesion in the cerebrum, or, at any rate, in the upper part of the intra-cranial motor tract. This view seems to me well worthy of consideration, and a careful attempt should be made to verify it.

Original Communications.

DISEASES OF THE EAR FROM BATHING.

By SAMUEL SEXTON, M.D.,

SURGEON IN CHIEF TO THE NEW YORK EAR DISPENSARY; AURAL SURGEON TO THE NEW YORK EYE AND EAR INFIRMARY, ETC.

The deeply-situated portions of the ear embedded in the skull are exceedingly liable to certain painful diseases, when their dense, bony case becomes a bed of torture, and their remote situation is an obstruction to the efforts made for their relief. The middle ear, with which we shall have principally to deal here, has passing through it a tube, one portion of which, the external auditory meatus, communicates with the air external to the body, and the other portion, the Eustachian tube, with the air as it exists in the throat. The vibrating membrane of the middle ear prevents the air passing through this tube.

In order that this portion of the ear may perform the function of conveying sound to the inner ear, its structure must be exceedingly delicate.

This delicate apparatus is constantly exposed to an ever-varying atmosphere which comes in contact with it on both sides, and is constantly getting it out of order, usually by sudden, acute inflammation.

This middle ear then, which is the portal, as it were, to still more delicate portions of the ear situated deeper yet in the petrous bone, is found to be quite susceptible to atmospheric influences, such as cold, violent vibrations, etc., the former setting up inflammation, and the violent vibrations rupturing the membrane, or otherwise damaging the organ by their shock.

If this organ now be immersed in an element wholly different from the one in which it is constructed for performing its normal functions, we may expect striking effects. Such an element is water, which in bathing, especially diving, is apt to be brought in contact with the sensitive middle ear, through either of the channels of communication previously referred to, the heavier water quickly displacing the air which naturally occupies the passages leading to the ear.

Although bathing is well known as a source of aural disease, I only became aware of its magnitude after special research during the bathing season of last year, which included the months of May, June, July, August, and September.

During this period of time, I saw in the public clinics of this city and in my office, about 800 aural cases of all descriptions, which included 65 having having their origin in salt-water bathing.

It may be interesting to those who may have here their attention drawn to this class of patients to state a result of my experience, namely: The majority of persons who contract aural affections from salt-water bathing are disposed to attribute them to "taking cold," etc, referring to the real cause only incidentally or after being closely questioned.

Indeed, patients will experience frequent exposures of this kind, and from them become quite deaf, without once suspecting the cause. This will serve to explain why bathing, as an exciting cause of earache or deafness, is so often overlooked by both physician and patient; for if it were not, there would be less imprudence in bathing, and even a surf bath would not be taken without caution. The plain duty of the physician is, in ordering baths for his patients, to give them such instructions as will prevent an agreeable mode of treatment becoming a source of painful injury.

I have seen of late several cases, mention of which will be made in an addendum to this article, where the Russian bath has provoked serious aural trouble, two of the cases being physicians. I have met with but few persons who felt the necessity of making any effort to protect the ears when bathing. A few, indeed, have some notion that a pledget of cotton wool protects the ears, and some hold the nose when diving.*

The entrance of water into the ear was well known in ancient times to be productive of aural disease.

Avicenne, a Persian physician of the tenth century, enumerates among the causes of aural disease, "water getting into the ear." †

When it is considered that so eminent an authority gave prominence to this source of a most common affection, we should indeed be greatly surprised that the subject is so much neglected in modern times.

It is not easy to make an estimate of the number of aural cases arising from bathing, but with the best data within reach it is safe to state that the physicians of New York City, with its population of 1,000,000, see no less a number than 1,000 during the bathing season. At least as many more do not consult a physician.

According to this approximation 1 in every 500 is more or less affected annually, and the number may be much greater.

Von Tröltsch estimates that only 1 person in 20 has normal hearing power.

As most statistics are collected in the large cities situated on the seaboard, we may conclude that many cases of deafness going to make up the list from which Tröltsch deduces his estimate are from deafness produced by salt-water bathing.

From this view chronic catarrh of the middle ear may not occupy so conspicuous a position as heretofore as the principal factor in causing deafness.

Before entering into an account of the manner in which water may reach the delicate structure composing the auditory apparatus, it may not prove uninteresting or uninstructive to view the construction of the ear in such animals as are compelled to live a portion or all of the time in water.

The marine quadrupeds which interest us most, such as the seal and the like, can remain under water a long time, and it is found that the construction of their ears is such that no damage can occur to the organ from their frequent excursions from a warm atmosphere to the colder element. We find that when diving they close the mouth and nostrils, and that they are provided by nature with a movable membrana which is drawn over the ear as they enter the water. Of course they do not breathe under water. The crocodile is similarly constituted.*

The water-shrew obtains the same protection when pursuing its game into water by the action of certain muscles which draw the meatus inwards, and at the same time close it.

The auditory apparatus of the whale is particularly instructive. The external auditory meatus is small, and begins externally with a narrow opening, finding its way to the tympanum as a long, tortuous tube.

This tube's construction would preclude the idea of its being intended to permit sound vibrations to reach the membrana tympani, and this indeed is found to be the case, for the tympanic membrane is convex outwardly—the opposite condition to that in man and other mammalia. The Eustachian tube, however, is very large, and is connected with the respiratory apparatus, which in this animal has frequent communication with the surface, and permits the sound vibrations to reach the tympanic membrane while the external meatus is submerged.†

The ear of the porpoise is similar to the above. The tympanic membrane and other important features are said to be absent in snakes and many of the saurians. Some lizards and frogs have an exposed membrana tympani. Moles, which burrow in the earth, have a closed meatus.‡

Animals living exclusively in water have the auditory apparatus specially adapted to their wants; and in some of the lower orders of marine life an auditory nerve has not been demonstrated. The latter, it is supposed, receive sound impressions by means of the shock imparted to the body. The subject might here be pursued much further with interest, but enough has been elicited to aid us very much in the investigation of the matter under consideration.

It is thus seen that all animals which live in water, or whose habits require that they should remain in that element a portion of the time, are provided by nature with ample means for protecting the organ of hearing.§

Man, however, has none of the amphibian's peculiar anatomical organization, with which he may safely shut out the water from his ears, and he is therefore in great danger when his head is submerged. The ears may be plugged, the nose held tightly closed, and the mouth shut when he dives, but much risk is taken even thus guarded, and practically it is not a protection, for ordinarily water will enter the ears at the meatus, or through the mouth and nostrils.

The water may act injuriously upon the ear in several ways. It may injure the drum-head by the mere force of impact, as when it is driven into the meatus with great violence in surf-bathing. This effect takes place more frequently where the individual has a very large auditory meatus. In fact, I have found the calibre of the auditory canal, in those whom I have examined for aural affections induced in this manner, to be larger than the average. And I have no doubt but that the Eustachian tube is also larger in the same individuals, and when an incoming wave dashes

* The inhabitants residing upon the sea-shore of both cold and warm countries, resort to bathing very extensively. The writer would be glad to hear from any one who has information bearing on the subject.

† Pilcher.

‡ Bergman and Leuckart: "Comparative Anatomy and Physiology." Stuttgart, 1852.

§ The naturalist interested in the further study of this subject will find abundant material at the N. Y. Aquarium. To the manager, Dr. H. Dorner, I am indebted for courtesies in preparing this article.

against the face, water may be freely driven into the Eustachian tubes by way of the mouth and nostrils. Large quantities of water may thus be taken when the bather is struck by a breaker unexpectedly.

When the face is turned away to avoid the splash the meatus is apt to receive it.

Or the injury may consist in an irritation of the cutis lining the meatus, some persons being very susceptible in this way.

The presence of cold water long retained in the meatus, as in diving, will set up inflammation in the parts exposed, namely, the meatus and drum-head, and in a great many instances the morbid action will extend to the tympanic cavity.

The effect of standing in the wind, after coming out of the water, and permitting the hair, ears, etc., to dry by evaporation, is also a frequent cause of aural inflammation.

Attacks of catarrh—colds—from the exposure of bathing are frequent, and inflammation of the middle ear may thus arise by extension through the Eustachian tubes from an inflamed throat.

Finally, a large number of cases are attacked through the entrance of water directly admitted into the Eustachian tubes through the mouth and nose. This latter has been so well described by Turnbull that I quote his own words.*

"But a still greater evil is from sudden deglutition, during diving or swimming, by which—the mouth, nose, and pharynx being filled with cold water, and the mouths of the Eustachian tubes open—a portion of the water passes into the middle ear. This result . . . is most common in beginners, who suddenly, from cold or shock of the contact of the water, breathe or swallow in a sobbing manner."

Simply blowing the nose for the purpose of freeing the passages of water may drive a sufficient quantity into the middle ear to set up inflammation.† Many persons have headache, earache, and other unpleasant symptoms from diving, and never repeat the experiment.

It is rather remarkable that the custom should be found to exist of always first wetting the head. Diving is the most approved method when bathing, and beginners are always enjoined to observe this as serving to ward off all evil results.

The sensation of getting "water in the ears" is disagreeable to all bathers, and they lose no time in jumping on one leg with the ear held downwards until it is freed of water. Some persons find salt water painful in the ears, but can tolerate fresh water, as in rivers. The remarks above made apply more especially to salt- or cold-water bathing.

The cold water of the sea is particularly obnoxious, on account of its comparatively uniform low temperature and the large quantity of chloride of sodium which it holds in solution, as it thus injures the ear by a direct cooling effect as well as by its highly-irritating character. The fresh water, however, of the great lakes is always very cold, and is almost as dangerous as sea-water.

The time occupied in out-door bathing is sometimes astonishingly protracted, children often remaining in the water for hours. Indeed, I have been informed by some that they have played there most of the day and evening, diving much of the time.

Many persons do not consider their daily ablution complete until the entire head has been immersed, or, at least, the hair saturated.

To the toilet now is frequently added the mopping out of the canal with a portion of sponge attached to a handle, which accomplishes no other purpose than to pack the meatus with a humid mass of wax, soap, and epidermic scales.

From these causes arise not infrequently mild attacks of earache, which receive but little attention, or are aggravated by such domestic remedies as pouring oil, laudanum, liquors, etc., into the ear.

I have recently been interested in a class of performers who have amused the public by staying under water from one to two minutes, and eating and drinking during that time. These people, by practice, acquire the necessary composure to perform this feat easily twice a day. One young woman, aged nineteen, had performed for three years and never experienced any deafness, but failed in her general health. I examined a sister of the one just mentioned, aged seventeen years. She had followed the business for one year. From her I learned that the water into which she dove was made about 80° Fahrenheit. Sometimes when cold water had to be used she could not remain under very long, or could not hold her breath at all, on account of the sighing it occasioned. If she draws water up her nose it chokes her, and on coming out she has headache and feels heavy for a time, perhaps ten or fifteen minutes. After the admission of water into the nostrils she holds her head down and it runs out. A portion of the time she wore a pledget of cotton-wool in the ears. She never had any sensation in her ears. Her sister and others always wear the cotton-wool in their ears when diving. The general use of warm water, and the absence of excitement makes this performance quite safe, the only real danger being the admission of water into the Eustachian tubes. Like the use of the nasal douche, it may be harmless in a great many instances, but is, nevertheless, a dangerous practice.

But in a certain number of cases the exposures I have referred to lead to most serious consequences, in some instances life itself being threatened.

All parts of the ear are liable to suffer from the inflammation which may thus be kindled, and when the middle ear is its seat the brain is frequently attacked through some of the numerous channels which connect these parts.*

The interval between the exposure in bathing and the first symptoms which indicate an inflammatory action to the patient, is from a few hours to a day, or possibly longer. I have the notes of a case where violent pain came on, and continued until seen by me, in five hours after "swallowing salt water." The manner in which the different portions of the ear are attacked, is well shown in the following table, condensed from the exhibit of cases at the end of this article:

TABLE SHOWING THE RESULTS OF SALT-WATER BATHING IN SIXTY-FIVE CASES.

Middle Ear.

	65

From the above table it appears that the middle ear is the most frequently attacked portion of the organ, for in addition to the thirty cases enumerated under that head, in four instances the middle ear disease was a prominent complication of an acute inflammation of the meatus.

In thirteen cases the drum-head was involved with the meatus, and the existence of tinnitus indicated strongly that the middle ear did not fail to sympathize.

In the nine cases in which the drum-head was involved, there was doubtless also more or less disturbance in the middle ear, although myringitis was the striking feature.

It is almost impossible to conceive of the existence of an inflammation confined strictly to the drum-head, as it is anatomically so intimately connected with the middle ear, its mucous layer at least being affected in all cases.

Inflammation occurring in the meatus alone in eight instances, points to the fact that this channel is frequently the place of initial invasion. It will thus be seen that, in the great majority of cases, the middle ear is affected, and indeed our apprehensions of danger increase in proportion to the extent of its disease.

In three cases the inflammation passed out of the middle ear, and involved the meninges of the brain, and the cerebral symptoms for a time seemed to endanger life. These cases all recovered after protracted illness, but details of them would be out of place here. I have observed a number of cases where the naso-pharynx and Eustachian tubes were unmistakably affected by the irritating quality of cold salt water, but as deafness was not a symptom, they do not properly belong here. It is probable that a few of the cases reported as non-purulent inflammation of the middle ear, became purulent subsequent to their being recorded, as they made but few visits after relief was obtained.

When the middle ear is inflamed, the mastoid cells are also more or less affected in most cases, and the integument and deeper structures in the whole temporal region are liable to be embraced. When the meatus is inflamed, the auricle is often swollen and sensitive to the touch. Mastication and swallowing become painful when the meatus is inflamed, owing to the swelling of the glenoid fossa which receives the condyle of the lower jaw.

As may be supposed, the first symptom which alarms the patient when the attack affects the middle ear is pain, and usually it is most violent; sometimes it is accompanied by delirium. From the beginning, often even preceding the pain, there is an almost equally distressing symptom, namely, tinnitus. It is described by patients as resembling the roaring of a cataract, the wind, violent escape of steam, etc. Deafness is always more or less marked.

Dizziness is usual, and often the patient is unable to walk without support, as holding on to some article of furniture, etc. These symptoms of course vary greatly.

In some instances from the start there is a subacute action, which never proceeds to serious results, the only annoyance being tinnitus and deafness. The latter is seldom absent, and does not depend altogether upon the violence of the disease. Patients are generally able to visit the physician, although their sufferings at night may be excessive.

Suppuration usually occurs in twenty-four hours, but there is, in acute cases, a collection of mucus in the middle ear, which, as it increases, distends the drum-head, and may not escape by bursting through that membrane for days.

The neuralgic pain ceases in most instances the moment the membrane gives way, or if perforated by the surgeon.

Although the inflammation may be confined to a small portion of the ear, the pain through sympathy affects the whole region, more or less.

In a certain number of cases, both ears are affected, perhaps one-fourth of the whole, although not always in the same degree, nor in any way sympathetically. Women are not so liable to attacks as men—they enter the water with their ears protected from dashing waves, are not divers to any extent, and do not bathe in salt water so frequently.

In the sixty-five cases which I have recorded, three only were females. The purulent discharge following an acute inflammation of the ear may continue for months or years if not arrested; it seldom ceases, under the most favorable circumstances, in less than three weeks.

Where the inflammation has not been severe beyond the meatus and drum-head, there is exfoliation of the epidermis covering these parts, which sometimes is cast off whole, resembling the finger of a glove in appearance. Where the entrance of water into the meatus loosens a plug of wax, it is apt to become impacted and produce the symptoms usual in that condition.

As regards the treatment of inflammation of the ear from these causes, it does not vary from that indicated in inflammation of the organ from other causes, and I shall therefore not dwell upon the subject here at length.

When fluid is pressing behind the drum-head, an early incision should be made in that membrane, for the evacuation of the contents of the tympanum.

Syringing the ear with hot water is nearly always grateful from the beginning of an attack; it relieves the congestion of the parts. Syringing is to be done gently, and repeated as often as is agreeable to the feelings of the patient. It should be continued during the treatment as long as secretions collect in the meatus, but with decreasing frequency as the suppuration lessens, a humid state of the parts being undesirable. The water used should be hot as can be borne by the patient.

After the active stage has passed, the ear may be dressed by placing a roll of absorbent cotton-wool in the meatus, either plain or medicated with some mild astringent, as borax, alum or tannic acid.*

When the drum-head is imperforate, and the middle ear affected only in a slight degree, if the Eustachian tube be free, rarefaction of air in the meatus will often aid the escape of mucus towards the throat, and hasten recovery.

In nearly every case leeches should be applied to the ear affected, usually directly in front of the tragus, or in the concha, or below the lobule, where the ear joins the head. They cannot be applied too quickly, as they relieve pain, and in some instances aid in preventing suppuration. If there is much tenderness over the mastoid, a free and prompt incision must be considered.

* For a description of the uses of medicated wool, see Record, March 2, 1878.

Abscesses in the meatus or in the neighborhood of the auricle are not infrequently met with, and should be incised early.

Any further details of treatment, together with the management of the accompanying deafness, would be beyond the scope of this article.

ADDENDUM.

FOUR CASES OF AURAL DISEASE FOLLOWING THE RUSSIAN BATH.

CASE I.—Dr. ——, age 52.—*Acute inflammation of inner extremity of meatus, drum-head, and middle ear.*

On Jan. 10, 1877, took Russian bath, including the plunge into cold water, which entered both meatus. Second day had acute pain, stuffiness—tinnitus, with complete deafness in left ear. Did not fully recover until June 25th.

CASE II.—R. T., age 36.—*Acute inflammation of middle ear.*

On May 13, 1877, took Russian bath, including the plunge. On May 19th left ear pained very much. He did not sleep much, on account of the pain, for two weeks. The inner extremity of left meatus closed, and the epidermis exfoliating. Was only seen twice; at second visit was free of pain.

CASE III.—Dr. ——, age 32.—*Subacute inflammation of drum-head and middle ear.*

June 25th, took Russian bath, including shower-bath and plunge. One week later had severe pain in the left ear. The meatus, drum-head, and middle ear were inflamed. The right ear slightly affected. Recovery in a few weeks.

CASE IV.—Mr. A. H. S., age 37.—*Impaction of wax producing acute inflammation of drum-head.*

Went in bath with the patient just described. Took shower and plunge after the vapor bath. On immersing his head had a feeling of uneasiness. Next day had decided pain in left ear, which kept him from sleeping. Pain was at times excruciating for the next three weeks. The impacted cerumen, which was found to be the cause of the irritation, was removed, and the membrane, against which it had been pressing, was highly injected and thickened. The right ear was filled with hardened wax. Recovery rapid.

None of these cases went on to suppuration, which is so characteristic of the inflammation following salt-water bathing.

Case IV. was, of course, one which might have suffered at any moment from the loosening of the wax.

In the Russian bath the patient usually remains in vapor at the temperature of 115° F. for about half an hour, and then plunges into a cold bath.

I have never heard of any aural affection being induced by the Turkish bath, where the patient remains for half an hour or longer in a dry atmosphere, heated to 140° to 180°, and is then gradually cooled off. In the latter bath it is not so common a custom to take the cold plunge or swim.

Conclusions.—The ear is far oftener the seat of inflammation and resulting deafness from bathing than is generally supposed. Although its delicate parts occupy a deep situation in the skull, which is usually a protection from objects capable of injuring it, yet in any bathing which includes immersion of the head it is liable to be more or less damaged.

This damage consists in the admission of water to the ear, either through the external auditory canal, or the Eustachian tube.

When water finds admittance to the former, if cold or salt, inflammation of the meatus alone may result, or if violently injected, as in surf-bathing, or long retained in the canal from diving, the disease may affect the drum-head and middle ear.

Whenever water is forced from the mouth and nostrils into the middle ear through the Eustachian tube, inflammation of the middle ear is almost sure to occur, even though the water be warm. This has been frequently illustrated in a most painful manner by those who have been induced to use the popular nasal douche, inflammation of an acute purulent character having frequently been thus established, which has been dangerous to the life of the patient, and after a tedious recovery left great deafness behind.

Frequent exposures, especially in salt-water bathing, may be the cause of slight earaches, which are usually neglected as unimportant, but which are frequently the precursors of much deafness.

The fact that several thousand severe cases of aural disease thus result annually in New York City alone, should be a serious admonition to all who are concerned; and that three of the sixty-five cases here reported had dangerous cerebral complications should be a further warning.

That bathing is pleasant and healthful is of course admitted, but that it cannot be practised as at present without danger is undeniable. It has been shown here by a glance at natural history that amphibia, whose life is passed indifferently in either air or water, have naturally the means of protecting their auditory apparatus; but man is not so constructed, and therefore he cannot with safety practise diving or submerging the head.

He should never dive if he wishes to preserve his hearing.

When in the surf he should take the water upon his chest or back closing the mouth and nostrils, being careful to not present the ear to the incoming wave.

It is equally dangerous while swimming to receive dashing water into the mouth or nostrils. A firm pledget of cotton-wool in the ears is some protection. Drying the hair and body, and dressing quickly after the bath are, of course, necessary precautions.

The neglect to observe care in bathing is well illustrated by the four cases of aural disease, which I have presented here in the addendum as originating from the Russian bath, two of the attacks happening to physicians. This should point to the necessity of our always putting a patient, advised to use any kind of a bath, upon his guard as regards the danger to the ear.

TABULAR VIEW OF SIXTY-FIVE CASES OF AURAL DISEASES FROM SALT-WATER BATHING.

No.	Age.	1877. Date.	
1	29	May 2	Acute inflammation middle ear—at age of three years, and subsequently, had attacks of earache from bathing.
2	16	June 14	Acute inflammation meatus and drum-head.

60	21	" 10	" " of meatus (and the nasal passage).
61	42	" 13	Subacute inflammation meatus and drum-head
62	12	" "	Acute inflammation middle ear.
63	33	" "	" purulent inflammation middle ear (and inflammation of meatus and auricle).
64	18	" "	Acute inflammation meatus and drum-heads unattended by pain or tinnitus.
65	12	" 15	Acute inflammation meatus and drum-head—one year ago had attack of acute purulent inflammation of middle ear from bathing.

12 West 35th St.

A Successful Operation.—Surgeon A. L. Cox, who died at Chattanooga, was an eccentric and enthusiastic army surgeon in the late war of the rebellion. One day, soon after the battle of Antietam, he essayed to amputate the mangled limb of a Connecticut soldier, and became so much absorbed in his delicate task that he did not notice that the man was dying. As he began sewing up the stump a hospital steward chanced along and said: "Doctor, there's no use of going on; the man is dead." The surgeon looked up in surprise, and then said: "I am sorry that the poor fellow is dead, but there is one consolation about the matter, he has gone to heaven with a 'flap' that he can be proud of."

Progress of Medical Science.

Glycosuria and Diabetes.—M. Duhomme claims that glycosuria and diabetes are two distinct diseases; the first an affection amenable to treatment and frequently met with; the second an uncontrollable and rare disease. The diagnosis is sometimes difficult, the two affections presenting many similarities. The following points, however, have been noted by this observer. The urine of diabetes varies but little from day to day in color, density, quantity, or in amount of sugar; the urine of glycosuria is remarkable for the irregularity of these characteristics. The reaction of diabetic urine with Fehling's test liquid is very satisfactory, each drop, as it falls into the reagent, produces a more and more marked discoloration, the precipitate is of a brilliant red color, and is readily deposited. If the urine of glycosuria contain much sugar, an equally marked reaction is produced; if a little less sugar be present, the precipitate is of a less brilliant red, and forms more slowly; if the sugar be trifling in amount, Fehling's test becomes valueless. The therapeutics of the disease is a valuable aid, for the classical treatment is effectual in glycosuria, but useless in diabetes.—*Gazette Hebdomadaire de Médecine et de Chirurgie.*

Etiology and Pathology of Chronic Joint Disease.—An article by Newton M. Shaffer, M.D., on the Etiology and Pathology of Chronic Joint Disease has been published in the third volume of "American Clinical Lectures." Just at this time the views of one who has had such an extended field of observation on this subject are especially worthy of notice. The origin of these joint affections Dr. Shaffer attributes to a constitutional predisposition to chronic inflammation, rather than to traumatism, which is never a prolific cause of chronic inflammation, its effects being rapid and acute. Acute joint disease (synovitis) does not usually, in his experience, degenerate into a chronic form of inflammation, while chronic joint disease has an antecedent history, vague and indistinct perhaps, but easily recognizable when once the local symptoms are present. The condition of a part suffering from the effects of traumatism is essentially one of malnutrition; the circulation is sluggish, the inflammatory products deposited in the tissues are not absorbed, and fasciæ, tendons, ligaments, are contracted through continued disease; but this condition is purely local, dependent on local causes and amenable to local treatment. In chronic joint disease, the malnutrition and sluggish circulation are general, and the arthritis but a local manifestation.

The primary lesion may be seated either in the bone or in the synovial membrane, the more frequent and by far the more rebellious to treatment being the affection of the bone. In chronic synovitis, the synovial membrane becomes soft and œdematous, the surface is covered with granulations which increase in size and become fungous in character. This fungous degeneration gradually encroaches on the articular cartilage, filling the articulation with its unhealthy granulations, and sending down processes into the substance of the cartilage, destroying it, and attacking the bone, producing fungous caries. At the same time the œdematous infiltration extends outwards, involving all the tissues, until it makes its appearance externally. Chronic osteitis attacks the epiphysis of one, very rarely of two, of the important bones of a joint. The rich vascular supply which is

called for by the nutritive activity of the epiphysis, renders this portion of the bone more liable than the apophysis to take on inflammatory changes, and the peculiar diathesis from which these patients suffer engenders a state of chronic congestion, which may, under unfavorable circumstances, degenerate into chronic inflammation, with the occurrence of a "regressive metamorphosis," that ultimates in caries and the formation of degenerate pus.

In the diagnosis of these two affections, Dr. Shaffer lays stress upon the absence from chronic synovitis of the muscular atrophy, the reflex muscular spasm, and the osteitic cry, of chronic articular osteitis. In the early stages, before suppuration has set in, a temperature of 100.5° or over, will almost exclude chronic joint trouble.—*American Clinical Lectures*, Vol. III., No. VI.

PARACENTESIS OF THE PERICARDIUM.—Paracentesis of the pericardium is not an operation to be lightly undertaken, but the following accession to the list of successful cases will tend to bring it into greater favor. The case is reported by Prof. Pepper, of the University of Pennsylvania. The patient, a well-developed girl of 17 years, was taken on Sept. 2d with præcordial pain, and soon developed all the symptoms of pericarditis with rapid effusion. On Sept. 9th, the respirations were 60, the pulse 145; præcordial pain severe, and dyspnœa very alarming. The urine contained slight traces of albumen and a few fragmentary hyaline casts; no œdema of any part, save a slight puffiness about ankles. On the 10th and 11th she grew worse, and had several slight convulsive attacks. Late on the night of the 11th, the respirations were 80, pulse 160, extremities cold. Each paroxysm of dyspnœa seemed as if it would prove fatal, and it seemed clear that death would occur before morning. With the consent of the parents, paracentesis was now performed, Dieulafoy's aspirator being used. The puncture was made in the fifth intercostal space, about one inch inside of the line of the left nipple, and about eight ounces of a reddish serum withdrawn. This fluid contained a large proportion of albumen, some red blood-globules, and much pseudo-fibrin. The effect was magical; the pulse fell to 114, and became full and regular; the respirations fell to 40, and she became quiet and comfortable. From this time the cardiac symptoms improved slowly but steadily, and the uræmia yielded gradually to treatment.

This makes the forty-fourth reported case, about twenty of which have been successful, but it must be recollected that many of these were unfavorable subjects. Prof. Pepper is satisfied that the operation is justified, and even imperatively demanded under certain conditions. "Under no circumstances," he says, "has the operation, if properly performed, been productive of any injurious effects; even in the most hopelessly unfavorable cases it has afforded great relief." The primary indication for its performance is the existence of a liquid effusion in the pericardial sac, which has not yielded to a thorough employment of other modes of treatment, and which is causing such grave disturbances of circulation and respiration as to urgently threaten life. Even in less urgent cases, if the liquid be purulent, the operation should be had recourse to, and it cannot be done too early. Dieulafoy's aspirator is without doubt the best instrument to employ, and experiments upon the cadaver have shown that the point of normal apex beat is the point of election. In conclusion, he says this must be regarded as a comparatively simple and safe operation, when the indications for it exist, and he does not believe that if the fluid collect again, it would more likely be purulent on account of its having been performed.—*The Medical News and Library*, March, 1878.

TREATMENT OF FRACTURES OF THE SHAFT OF THE FEMUR.—To muscular contraction has generally been attributed the shortening following fractures of the femur, but Dr. Bauer, of St. Louis, denies this as the prime factor, although an active element at the time of fracture, and whenever the muscles are directly irritated. Hamilton considers the lower fragment to be drawn under the upper one by muscular contraction, and that the proper treatment is by extension and counter-extension to overcome this muscular action. In direct opposition to these views, Bauer says: "We hold that the upper fragment is pushed over the lower by the simple bending of the trunk of the patient towards the injured extremity for the simple purpose of relieving himself from, and changing the irksome straight position." As a corollary to this he claims that the indication is, not to extend the limb, but to prevent the pushing down of the upper fragment, and this is best accomplished by means of a double inclined plane properly fitted and adapted to each individual case. The apparatus he recommends is of sheet-iron, properly shaped, and well padded with cotton batting. This has been used in a number of cases with good success, as fully established by measurement in the erect posture. To accomplish this the patient is placed erect on an even floor and a plumb-line suspended from the seventh spinous process of the cervical vertebra. If the limbs are of equal length, the line will be parallel with the spine and internatal groove. If, however, one extremity be shorter than its mate, the line will drop on the opposite side of the groove. By raising the shorter limb the groove and line may be made to coincide, and the thickness of the block required to effect this will be equal to the difference between the limbs.—*St. Louis Clinical Record*, March, 1878.

GONORRHŒAL EPIDIDYMITIS.—Dr. F. J. Bumstead, in the *American Practitioner* for March, has given a résumé of the treatment of gonorrhœal epididymitis. His own treatment on the first appearance of swelled testicle consists of absolute rest in bed, the administration of a free cathartic, and a restricted diet; an opiate may be administered at night if necessary. The testicle should be well supported, and an evaporating lotion applied. At night the scrotum may be smeared with the following mixture: ℞. Ext. belladonnæ, ʒ ij.; glycerine, ʒ ss.; aquæ, ʒ i. The scrotum should then be covered with a piece of lint moistened in the same. The immersion of the testicle in very hot water for ten to fifteen minutes, and then pouring upon it from a height a stream of cold water for five minutes, as recommended by Dr. Edwin Lloyd, is sometimes productive of very good effect. After the subsidence of the epididymitis, more or less fluid will, in the majority of cases, be detected in the sac of the tunica vaginalis; and here instant relief may be given, and further progress of the disease cut off, by the multiple punctures of the scrotum so highly recommended by Velpeau: "So great is my confidence in the effect of these incisions, that I do not hesitate to tell a patient that if he will submit to them he will be on his feet again in two or three days." The writer has never seen any ill effect from them, although Montanier reports a case in which simple incision into the tunica vaginalis was followed by excessive hemorrhage. Mr. J. L. Milton says: "The surgeon's first object is to arrest *pain; with this the inflammation stops.*" He ac-

complishes this with morphia, and applies externally the following lotion: ℞. Liq. ammon. acetatis, ʒi.; sp. ætheris, ʒiss.; mist. camph., ʒiijss. M. Prof. Marshall suggests the oleate of mercury with morphia. Dr. Ed. Warren injects into the tunica vaginalis one-sixth of a grain of morphia, and straps the testicle; internally he gives bromide of pot. grs. xx., tr. gelsemium sempervir. ℥ xv., fl. ext. ergot ʒi., in half an ounce of cinnamon-water every three hours. Drs. Piffard and Fox use pulsatilla, giving a drop of the "mother tincture" every one or two hours. The application of ice has been very highly recommended by M. Diday and others; the rule Dr. Bumstead follows is, if it does not afford relief within two hours, give it up and try some other plan. Poulticing is an old-fashioned mode of treatment, but is doubtless of service in some cases when the patient is unwilling to submit to puncture of the tunica vaginalis. Strapping the testicle is only applicable after the swelling and pain have subsided. This plan is much less used now than formerly, and, according to Cullerier has been entirely abandoned in France. Prof. Thiry, of Brussels, however, very strongly advocates this treatment; he uses it in the "période de stade," that is, when the inflammation has fully reached its height, not waiting for the decline of the symptoms. Dr. Marc Girard applies to the affected testicle lint soaked in a solution of nitrate of silver, one part to a hundred of water; in five cases treated in this way the pain ceased in about twenty-four hours, and the average length of treatment was six days. Its mode of action is unknown. M. Vidal revived Petit's operation, which consisted of an extension of Velpeau's incisions into the substance of the testicle. Vidal used this in over four hundred cases, and prefers it to any other method. But one puncture of this kind is made, the lancet entering the testicle to a depth of less than three-tenths of an inch. Mr. Henry Smith, of King's College Hospital, advocates the same treatment, and states that he has met "with results which have astonished himself and his numerous pupils." Prof. Bock, of Christiana, injects a few drops of a solution of nitrate of silver into the prostatic urethra. Dr. Waterman, of Indianapolis, administers internally acetate of potassa with acetate of morphia, and applies locally a liniment composed of tr. iodinii, aq. ammoniæ, tr. opii, ol. olivæ, graduating the dose of morphia so as to secure full, but not excessive anodyne effects, and the proportions of iodine and ammonia so as to cause a half-blistering of the skin. The pain is said to cease, sometimes in three hours, and the effusion to be rapidly absorbed. Dr. Julian Alvarez relieves the pain in the course of one or two hours by the application of iodoform ointment. If the induration of the epididymis persists after the subsidence of the acute symptoms, the mercurial ointment, or ung. plumbi iodidi, or an ointment of iodoform, should be tried, and the iodide of potassium should be administered internally.

Writers' Cramp.—In a paper read before the Royal Medical and Chirurgical Society, Dr. Poore gave an analysis of seventy-five cases of writers' cramp and impaired writing power. These cases fell naturally into six groups: 1. Paralytic (six cases). 2. Spasmodic (five cases). 3. Degenerative (nine cases). 4. Neuralgic, or neuritic (nineteen cases). 5. Writers' cramp (thirty-two). 6. Anomalous (four cases). The spasms which affect the hand, and which are particularly prone to follow attacks of hemiplegia, owe sometimes, there is good reason to believe, their character, if not their origin, to a faulty antagonism (due to a secondary paralysis or paresis) among the muscles of the paralyzed limb. Although such spasms are usually attributed to disturbance of the gray matter, they might easily be due to a loss of equilibrium between the antagonistic muscles of a limb, especially when voluntary control is lessened by a lesion of the central ganglia. Loss of writing power is often the first and most prominent symptom of degenerative change occurring in the spinal cord or brain. The neuritic or neuralgic group is characterized by a painful and tender condition of the nerves of a limb, produced by overwork, or more frequently by injury combined with exposure to cold and a depressed state of the health. It is not always easy to distinguish these cases from true writers' cramp, but it is characteristic of the neuralgic group that—1. The symptoms involve a wider area; 2. The symptoms are sometimes induced without excessive exercise of any function; 3. Nerve-tenderness or neuralgia is a prominent symptom. In the group of true writers' cramp attention was directed—1. To the inferences which may be drawn from an inspection of the handwriting; 2. To the fact that the joints were found to be implicated no less than twenty-one times, the joint affection being rheumatic, neuropathic, gouty, or due to strained position; 3. To the fact that a difficulty in writing is not very infrequently hereditary, or developed very early in life; and that, 4. Any evidence of involvement of the nerve-centres is decidedly rare. The existence of a special co-ordinating centre for the controlling of the act of writing seems to the writer impossible, because—1. He had never seen a case of writers' cramp without peripheral evidence of change; and in the majority of cases there had been no evidence of any change other than peripheral. 2. If there be a co-ordinating centre for writing, it must be created, as it were, by education. 3. Writers' cramp is never suddenly established, as aphasia sometimes is. 4. It is almost certain that a peripheral lesion may cause all the symptoms of writers' cramp. The relative frequency of this, as compared with other professional ailments, is due to the fact that prolonged strain of the muscles which hold and steady the pen is inseparable from the act of writing.—*Medical Examiner*, Feb. 28th.

Heart-Clots.—The prognosis of heart-clots is usually considered to be necessarily and speedily fatal, but, from an analysis of three cases occurring in the practice of Dr. James, of Richmond, and in sixty-eight reported by others, Dr. James draws conclusions a little less gloomy, believing that cure may even sometimes result. One of his patients presented evidences of the existence of the clot a week before death, another two weeks, and a third for upwards of seven months. Turnbull and Lancereaux mention cases lasting a month and upward. Thus the existence of a heart-clot is not in itself fatal, and there is a possibility of its breaking down and being swept off in the current of the blood, giving rise, perhaps, to embolism, infarction, etc., but these are conditions from which, under favorable circumstances, recovery may take place. The possibility of this is proved by cases reported by Chisholm, Tanner, Turnbull, McDonald, Anderson, and others. The clinical record of the treatment is not very bright; the most successful has been the free use of stimulants and anodynes. Among the stimulants the author considers ammonia to hold a front rank, but the effect of this drug upon the blood should be remembered. As a prophylaxis, the prevention of stasis of blood in the heart is of the greatest importance.—*Reprint from Transactions Medical Society of Virginia.*

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, May 4, 1878.

THE ABUSE OF MEDICAL CHARITIES.

The recent report to the County Society of the Commitee on the Abuse of Medical Charities brings up again for general discussion a subject which is always interesting to medical men. The report very properly takes the ground that there should be some discrimination made by the hospital and dispensary authorities between paupers and well-to-do patients; that some guarantee should be given to the profession for the faithful execution of such obligations. The certificate system promises a great deal in this direction, and its merits deserve a thorough canvassing. In a general way nothing can be more rational. The practical difficulties, however, are in the details which are necessary to make the plan effective.

Unless such a system can be carried out with an impartiality that is unquestioned it is liable to great abuses. In Great Britain, for instance, the issue of certificates has in some cases been as indiscriminate and as unwarrantable as the bestowal of medical charity in any of our college clinics, or in the admission of patients to the Out-door Departments of the New York or Bellevue Hospitals. In fact, not long ago, this certificate system was considered to fall so far short of its real object that the trustees of certain of the institutions affected by it advised its discontinuance. The latter was, of course, on the ground of an abuse rather than a use of its benefits.

It is well, however, to take such possibilities into account in advising reforms in our own systems. We can at least benefit so far by the experience of others who have gone before in guarding against errors that they committed, and which have led to the results as stated. There it is a common practice to issue tickets or certificates for treatment to persons who subscribe certain sums to the dispensaries. These tickets are, of course, not used directly by the subscribers, but are distributed to their friends, who receive free treatment accordingly. Not only are these certificates issued to improper persons, but the authorities have no more right to deny free treatment to the holders than has a bank to refuse the payment of its certified check. It has been stated that the larger number of these subscribers are tradesmen, who not only do not care to inquire into the real need of an applicant, but who actually use their tickets as an extra inducement for customers It would appear, however, that with our present system of managing dispensaries this practice could be guarded against.

The other abuses do not amount to much, and can be so effectually overcome by care as to ordinary common-sense detail that no particular reference to them is desirable. The trouble will be not in the certificate system, but in its proper management. The latter can be accomplished by the material which is already at hand, all that is required being a unanimity of action, not only on the part of the managers of these institutions, but of the profession at large.

The Committee has expressed itself very emphatically against the general principle of indiscriminate charity, as practised by the Out Patient Department of the New York Hospital. There is not a gentleman in the profession who can offer the least possible objection to the stand taken. The question is not how many patients are treated in this manner, or how little profit is made from the practice, or how few undeserving ones apply, but what excuse is there for such a public violation of trust on the part of the managers with the profession, as is implied in the deliberate publication of the rules governing their Out-Patient Department? With mere corporations abuses are oftentimes winked at because there appears to be no remedy for them, but in the instance before us they are openly invoked, and not only is a premium placed upon fraud, but the young and plodding practitioner is cheated out of his daily bread. The institution advertises in a way that the young practitioner does not dare do, and with money that was given for charitable purposes only, offers to his legitimate patients inducements in the way of accommodations, appliances, and treatment, that are far beyond his means, and for a fee of a dollar per month. What is the result of all this? Independent of the cheapness of the arrangements, patients are very often induced to avail themselves of the services of such distinguished men, to the virtual neglect of their family attendants. In fact, the supposed extra value of the services is sufficient to quiet the conscience of most patients, regarding any particular obligations to their regular medical adviser. In the meantime the practitioner grows poorer and poorer, his patients leave him, and the annual report of the hospital managers states, concerning this Out-Patient Department, that the "increasing demands upon it by a respectable class of applicants, largely from the rural districts, is rapidly demonstrating its value." But as the whole matter is now fairly before

the Comitia Minora, we leave it there for the present.

We beg to remind the Committee that the question is not one with the managers of the New York Hospital merely, but with the managers of all the hospitals in the land; and as such, its solution will interest the whole profession. If we allow such a precedent to be established, all hopes for reform of ordinary and lesser abuses of medical charity will forever end.

The portion of the report of the Committee referring to gratuitous professional service in hospitals invites a word or two of comment. The Committee state that such a practice is unbusinesslike, and leads to professional poverty. At the risk of appearing to speak against the pecuniary interests of the profession generally, we take issue on these points. It is true that all persons connected with these institutions, from the steward to scrub-woman, receive pay for their services, but the surgeon or physician receives his compensation in another way, by increased opportunities for experience. Aside from this medical services are never grudged to the poor. This is so universally the rule that the recommendation of the Committee will be viewed by the majority of the profession as an absurdity. But we may have more to say on this particular point hereafter.

Reports of Hospitals.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, March 18, 1878.

DR. JOHN C. PETERS, PRESIDENT, IN THE CHAIR.

DR. L. H. SAYRE exhibited an hemorrhoidal tumor which was removed by the écraseur. The operation differed from the ordinary one in that the strangulation was made rapidly.

EXTIRPATION OF SUPERIOR MAXILLA.

DR. MASON presented the left superior maxilla, which he had removed by operation from a female aged thirty-four years, a patient in Roosevelt Hospital. Two years ago she suffered from an abscess in the vicinity of one of the molar teeth. In due time there was a spontaneous discharge of pus. Shortly after this a growth made its appearance in the neighborhood, but it did not increase rapidly, or give rise to any special pain, until two months ago. At the time of her admission to the hospital she was very much run down by excessive pain, which was confined to the left side of the face and to the region of the orbit. The vision of one eye was slightly impaired. The tumor filled the whole of the antrum, projecting internally into the nares and upward upon the orbit, causing the eye to bulge slightly forward, and also involving the outer surface of the alveolar process and the roof of the mouth. The incision was made by Fergusson's method, and the whole of the superior maxilla removed, leaving its periosteum intact. Tumor was examined by Dr. Delafield, and found to be a spindle-cell sarcoma. He alluded, in connection with this case, to a similar operation which he had performed upon a patient six years ago, with the result of a reproduction of the bone.

PELVIC CELLULITIS FOLLOWED BY INTERSTITIAL GASTRITIS AND HEPATITIS.

DR. LOOMIS exhibited the stomach, gall-bladder, pancreas, and small portions of the liver and peritoneum removed from a German lady, aged forty-three years, and the mother of three children. She first consulted Dr. L. in the fall of 1875, for dyspepsia, as she termed it, having been under treatment for that complaint for some time in Germany. She was rosy-cheeked, and altogether was the last person to be suspected of having any grave disease.

After careful and repeated examinations of her case at that time, a diagnosis was made of chronic interstitial gastritis and hepatitis. The reasons were that the area of the liver was diminished; that its surface, as far as it could be reached, was smooth; that the patient was of temperate habits, and that she had suffered after her last confinement with what appeared to have been pelvic cellulitis and peritonitis. Dr. L. had before his mind a case with a similar history, which he presented to the Society two years ago, and in which at the autopsy the lesions of the diseases referred to were found. In that case there was a marked thickening of the capsule of the liver, which condition was evidently the result of an old peritonitis, developed during the attack of pelvic cellulitis. Dr. L. also discovered a mass of hardened tissue in the epigastric region, but as this presented no definite outline, the idea of cancer was not entertained.

She visited Dr. L.'s office until the latter part of April, gradually losing ground and fading in color. She then complained of enlargement of the abdomen. This, on careful examination, was found to be due to tympanites merely. She then consulted a prominent gynæcologist of this city, who stated that she had stricture of the rectum, that the distention of the abdomen was a consequence, and that an operation would relieve her. Finding that Dr. L. had charge of the case, he was invited in consultation. Dr. L. not agreeing in the diagnosis, and regarding the case as a hopeless one, resigned all connection with it, expressing the wish that she might be cured. About six weeks after the operation Dr. L. was invited to see her again. He found the abdomen more distended than ever, and that she was still losing flesh. The abdominal cavity was then one-half filled with fluid. She subsequently came under the care of Dr. L. again, and a consultation was held with a prominent physician, who agreed in the diagnosis originally made. The patient was tapped soon after, and about twelve quarts of clear fluid were drawn off. She then went to Saratoga, and was under the charge of Dr. Lente until the middle of August. While there she had a severe attack of diarrhœa, which so prostrated her that she was brought to the city on a mattress. She was tapped by Dr. Lente while in Saratoga, and when she returned to the city the operation was repeated by Dr. Drake. At that time she vomited almost everything that she took upon her stomach. After tapping her, Dr. Drake discovered a tumor just above the umbilicus, two inches in length and one inch in width. He was then of the opinion that the disease was cancer of the stomach. During Dr. Loomis's absence from town, there was another consultation, and the diagnosis was made of rum-drinker's liver; and soon after this still another consultation with a distinguished gynæcologist, when the case was decided to be one of sarcoma of the uterus and intestine. From that time the patient gradually sank and failed, so that when Dr. L. returned from the country, she was a mere skeleton. She was tapped a few days after, and

for the first time some floccules of lymph were found in the fluid. She died on the 10th of November.

At the autopsy the lungs and heart were in a normal condition. There was a slight amount of fluid in the peritoneal cavity. The abdominal cavity contained three quarts of turbid fluid, and the peritoneum was thickened, presenting the ordinary appearances of chronic peritonitis. The small intestines were bound together by adhesions. The uterus was retroverted completely and enlarged, but contained no tumor. The rectum was not the seat of stricture, although there was thickening of the peritoneum and of the tissues about the rectum. The stomach was one-third its normal size, its walls being thick, firm, and almost cartilaginous. The pyloric orifice was much diminished in size, as was also the gall-bladder, the walls of which were thickened. The pancreas was adherent to the stomach, and through it to the liver, making a continuous map of thickened tissue. This was examined by Dr. Arnold, who failed to find any evidence of cancerous degeneration. The uterus was bound down by the same character of tissue-formation. In a word, the case was one of chronic peritonitis with chronic interstitial gastritis. The liver was also involved in the action, but to a less extent, its capsule being very much thickened, but the connective tissue of the organ not much increased.

In conclusion, Dr. Loomis again referred to the case presented by him two years ago. At that time Dr. Putnam-Jacobi stated that she had met with two such cases of interstitial gastritis, and in both instances they were antedated by attacks of pelvic cellulitis.

Dr. Van Gersen—Do you suppose that pelvic cellulitis was the direct cause of the subsequent disease?

Dr. Loomis—That is my supposition, although there are no means of proving it by the autopsy.

Dr. Van Gersen then referred to the case of a child aged thirteen years, in which there was a history somewhat similar to the one related, and in which Dr. Jacobi made a similar diagnosis, giving the opinion that the disease originated in pelvic cellulitis. The starting-point in that case, however, was a scrofulous diathesis, attended with marked enlargement of the glands. He did not see the termination of the case, but he recollected the diagnosis.

Dr. Loomis—There was no hereditary or acquired taint in this case. The point which interested me was the diagnosis; when the tapping was first performed, she was seen by some good men, who did not suspect any peritonitis. The question was, whether the peritonitis existed at that time or not.

Dr. Janeway stated that he had seen many cases of chronic peritonitis, the nature of which, either from pain or any other usual sign, was not suspected. One such had been tapped for ovarian dropsy.

Dr. Peters remarked that simple thickening of the stomach was very rare. In 1844 such a case was reported to the Society, but very few had occurred since then.

PYELITIS—COLON AND PELVIS OF KIDNEY COMMUNICATING.

Dr. Bridge presented the kidneys, ureters, bladder, and prostatic urethra, with the following history:

They were taken from a young man who died at Trinity Infirmary, November 9, 1875. The history of the case, so far as I have been able to obtain it, has been taken from the records of St. Luke's Hospital, of which the patient was for a considerable time an inmate, and from a few oral notes furnished by those who had him in charge.

The history is a meagre one, and ante-mortem seems not to have sufficed for a positive diagnosis, since different diagnoses were made as to the true nature of the disease which proved fatal; but the post-mortem specimen which I offer seems of sufficient interest, even without a history, to occupy the attention of the Society for a few moments. The history, so far as could be obtained, is as follows:

George H. Bohne, a German, æt. 18, single, was admitted September 25, 1874, to St. Luke's Hospital. Seven years previously he was kicked in the perineum by a schoolmate, but besides this was aware of no cause which might have originated the disease of which he died. Within a few days he noticed that he had to micturate more frequently than before the accident.

In 1872, five years later, he began by slow degrees to pass water still oftener, and occasionally tinged with blood. Since then this condition unchanged until he entered St. Luke's in 1874. At that time the urine would be clear for several days together, then it would contain blood and pus, and a few clots ragged in shape, and though two or three times longer one way than the other, still not moulded by the urethra. Micturition was not painful, but occurred on an average three times during the night, and much oftener in the daytime. The bladder was carefully examined for stone, but nothing found. The prostate gland was normal in size and contour. The urine on examination was found to be normal in quantity, loaded at times with urates, and contained albumen, but not more than could be accounted for by the amount of blood present. In the sediment were pus-corpuscles of very large size.

November 6, 1874, the patient was etherized and examined for stone; none was found, the meatus being narrow and slit up so as to admit No. XV. From this time until December 3d gallic acid and tincture ferri chlorid. were taken in large and frequent doses, without improvement. The attempt was made to define the point of origin of blood passed. The bladder was emptied, the first ʒ i. containing clots; the urine following was bloody, but free from clots. A flexible rubber catheter was introduced and the bladder washed; with such washing the water became clearer, but the last ʒ i. contained considerable blood. The bladder being finally washed moderately clean, the catheter was tied *in situ*. After fifteen minutes the urine was as bloody as ever. For four hours subsequently long clots were passed of the calibre of the catheter. During the two hours following this, ʒ iij. of urine were passed nearly free from blood, but containing pus in moderate quantity. This examination seemed to point to the neck of the bladder as the source of the blood, which seemed to have clotted within the catheter pure. The clear urine passed excludes the kidneys as the origin of the hæmaturia. There was no history of seminal emissions.

December 10th.—Strictures were found at five and at one inch from meatus.

An examination was made by one of the staff of surgeons with the endoscope, and several reddish points or granulations were discovered in the prostatic portion of the urethra, which bled on being wiped with cotton.

During the winter a tumor began to develop in the left lumbar region (considered by some malignant, by others non-malignant).

October 6, 1875, the patient entered Trinity Infirmary. During the month preceding suffered from vomiting, which occurred from one to four hours after eating. No pain in tumor complained of.

October 30th.—Dr. Hockley drew off 3½ ʒ of pus

from the tumor by aspiration. No febrile reactions occurred. The patient died November 9th.

At the autopsy about one quart of pus and cheesy matter was found in the left kidney. The descending colon was adherent to the tumor, and an opening from it into the sack of the kidney was found large enough to allow the passage of an ordinary lead-pencil. The patient had in life passed pus from the bowel.

No examination of other organs than those above mentioned was made.

CHRONIC ENDOCARDITIS (THICKENING AND RETRACTION OF AORTIC VALVES) TRICUSPID REGURGITATION—HYPERTROPHOUS DILATATION OF HEART—HYDROTHORAX—COMPRESSED LUNG—BROWN INDURATION OF LUNG—RED ATROPHY OF LIVER—CHRONIC CONGESTION OF KIDNEYS.

DR. BEVERLEY ROBINSON presented specimens with the following history: They were taken from the body of a woman, twenty-eight years of age, who died in Charity Hospital, March 4, 1878, and were given to me by Dr. E. A. Maxwell, one of the curators to the hospital. They appear to me of considerable interest, and for that reason I desire to show them to the members of the Pathological Society.

The following are a few data taken from the patient's history: She enjoyed good health until eight years ago, when she suffered from an attack of acute rheumatism. Dyspnœa began three years since. Habits of intemperance nearly all her life. Has had swelling of feet, headache, and dizziness for a long time—as well as she remembers, about five years.

Two weeks previous to entrance into hospital (Dec. 12, 1877), had for first time an attack of severe pain in the chest, irradiating down the left arm. When patient entered hospital (Dec. 27, 1877), she was breathing with great difficulty, her face was cyanosed, her extremities cold; respiration, 60 in the minute; pulse, 130, very irregular and intermittent; subcrepitant râles were heard over both lungs; her heart was beating tumultuously, and no murmurs could be distinguished; albumen was found in the urine in moderate quantity.

A day or two after admission to the hospital, a cardiac murmur was heard at the apex and carried towards the axilla. A double murmur was heard at the base of heart, and a murmur was detected in the arteries of the neck. In the recorded history on the books of the hospital it is not mentioned at what sounds of the heart these murmurs severally occurred. There was a heaving impulse and *purring thrill* over the precordial region. Percussion showed increased cardiac dulness.

On Jan. 18th the pulse was found jerking in character, and a double murmur was found to the right of sternum over fourth intercostal space and conveyed to the right. It was supposed to be distinct from the murmurs previously mentioned. A few days later patient had epistaxis, spat blood, and complained of much pain in right side. Signs of pneumonic consolidation were discovered in right lung. Patient had several attacks of orothapnœa whilst in the hospital, which were relieved by inhalations of nitrite of amyl. She died quietly on March 4th.

Autopsy, ten hours after death.—Body in condition of general anasarca. Both pleural cavities are filled with blood-stained fluid. No adhesions on either side.

Lungs.—Both show compression throughout, most marked at bases. There is also a moderate amount of brown induration in both lungs.

Heart weight, twenty ounces. By hydrostatic test there is free regurgitation at aortic orifice and slight insufficiency of the tricuspid valve. Both ventricles are dilated. The walls of the left ventricle are notably thickened and of yellowish brown color. The free margins of mitral valve are slightly thickened, and the auricular surface is roughened. The endocardium of left ventricle shows patches of chronic endocarditis. The liver presents the appearance of red atrophy. Kidneys are in a condition of chronic congestion. The other organs are uninteresting. The above details are taken from a post-mortem record by Dr. E. A. Maxwell.

HOW IS THE PURRING THRILL PRODUCED?

In conclusion, Dr. Robinson asked concerning the explanation of the purring thrill in this case.

DR. LOOMIS said that he had come to regard a purring thrill as indicating one of two conditions: either stenosis of the mitral orifice, or mitral regurgitation with marked dilatation of the left ventricle.

DR. JANEWAY thought that there was either mitral stenosis or aortic regurgitation in these cases, but did not think it possible to have mitral regurgitation. The purring thrill in this instance, he thought, was explained by aortic regurgitation.

DR LOOMIS had met with it in mitral regurgitation simply, and thought it was due to the vibration of the cordæ tendinæ in the dilated cavity of the left ventricle.

DR. JANEWAY could not understand why this should be so, it being contrary to his observation.

DR. LOOMIS explained as follows:

As a result of regurgitation, the left auricle and the veins in the lungs become distended, and an abnormal quantity of blood is pressed into the left ventricle, causing dilatation of the left ventricle; then hypertrophy of ventricle takes place—just the same results as in aortic regurgitation. The only necessary condition was that, for the production of the thrill, there should be a vibration of cordæ tendinæ in the dilated cavity.

DR. JANEWAY said that in cases of simple mitral regurgitation the rule was, according to his experience, that the left ventricle scarcely dilated at all, but that the right ventricular wall was hypertrophied.

DR. LOOMIS asked if in mitral regurgitation it was not generally the rule to have hypertrophy and dilatation of the left ventricle.

DR. JANEWAY answered, not to any extent.

DR. LOOMIS said such was contrary to his experience.

DR. JANEWAY repeated his belief that the purring thrill was either due to aortic regurgitation or mitral stenosis. Niemeyer considered the thrill almost pathognomonic of mitral stenosis.

DR. ROBINSON asked if that condition could be diagnosticated before death.

DR. JANEWAY had succeeded several times.

DR. LOOMIS asked if the purring thrill did not occur with the first sound.

DR. JANEWAY had felt it presystolic.

In answer to a question, Dr. Loomis explained the cause of the thrill as a vibration of the cordæ tendinæ during contraction of the ventricle. He could not see how the thrill could be obtained without vibration, and how the vibration of the cordæ tendinæ could occur without dilatation of the left ventricle.

DR. JANEWAY was convinced of the possibility of absence of mitral regurgitation in such cases by the results of autopsical examinations. He believed that the thrill could be produced in aortic regurgitation by two currents of blood meeting in the ventricle.

REMARKABLE REPAIR AFTER EXSECTION OF HIP.

DR. SAYRE presented a specimen of remarkable repair after exsection of the hip, with a view of illustrating the value of the operation and the chances of improvement afterwards.

He saw the case first on the 22d July, 1875, when the child was two years and nine months old, but very small for her age. She had an immense abscess on the left hip, discharging freely, and the probe reached dead bone. The left limb was strongly adducted across the right thigh, and flexed at an angle of forty-five degrees with the pelvis. The abdomen was immensely distended and the liver enlarged. The child was thirty-three inches long. Was advised to be put in wire cuirass with slight extension, to keep out of doors, take cod-liver oil and iron, and if no improvement followed, to be exsected when the weather became cooler.

She was brought to Bellevue Hospital, Sept. 29, 1875, and the following history is copied from the records of Bellevue: Ward 12, Bellevue Hospital, September 29, 1875. Rosy Mullens, æt. 3, U. S. First suspicion of disease occurred to mother last November, on noticing her child standing mainly on the right leg, holding the left slightly bent. Some one said that the child fell and struck on the left hip, but mother knew nothing of it. After that, baby stayed in bed, or sat up, but did not walk. Swelling took place about the hip, but the mother was confined, and paid little attention to it.

In the latter part of January (1875), she called on a doctor, who lanced the swelling and let out pus and blood, since which time discharge has continued.

Child has grown thin, appetite failed, her back has gradually curved more and more, and her thigh adducted more strongly.

On day of admission (September 29, 1875), Dr. Sayre performed the operation of exsection of the hip-joint, according to his method, the child being anæsthetized, in this case, by chloroform. He made a curved incision over the trochanter major of about two inches in length. The head of the bone, neck, and part of great trochanter and ligamentum teres had been absorbed, acetabulum perforated, and all that remained to be done was to pick out a few loose fragments of the bone, and saw off the upper end of the shaft of the femur just above trochanter minor. He then, with his finger, scraped off the lining membrane from the sinuses, filled the wound and sinuses with balsam of Peru, put in oakum tents, and placed the child in wire breeches, the dressing not to be removed for three days; child gets ℥ x. of "Loomis's tonic," t. i. d.

Oct. 1st.—Child has done well. A.M., P. 140, R. 32, T. 99¾°; P.M., P. 125, R. 36, T. 99¾°. Wound dressed to-day. Oct. 2d.—A.M., P. 116, R. 36, T. 98¾°; P.M., P. 106, R. 46, T. 100°. Oct. 3d.—Wound discharging freely. Child is less irritable; appetite improved. A.M., P. 120, R. 40, T. 99°. Oct. 4th.—Temp. in evening normal. Oct. 5th.—Temp. in evening 101¾°. Quinine, gr. iij., ordered. Oct. 9th.—Child has improved slowly. Temp. has not been elevated but once until to-night, when it was 102¾°. Ordered ʒ i. ol. ricini, which operated before morning. Oct. 10th.—This night, child seemed to have some laryngeal trouble. Examination showed some bronchitis and considerable mucus in throat. Ordered warm fomentations to throat and chest, and gtt. x. each of paregoric and syr. scillæ. The next morning the child was found much better, yet it was thought best to omit dressing it. Oct. 12th—Quinine and iron stopped, and the following ordered t. i. d.:

℞. Ammon. carbonat.....gr. iv.
Spts. vini gallici.....ʒ i.
Syr. simple.....ad ℥ ij.
M.

Oct. 13th.—P. 114, R. 42, T. 99°. Oct. 30th.—Pulse has continued to range from 120 to 140; most of the time was 136; occasionally as high as 154. Respirations from 40 to 60. Temp. from 98¾° to 101°, being most of the time below 100°, once mounting up to 103°. The discharge is diminishing; the opening over trochanter is closed; the sinus, posteriorly, is still open; child's appetite has been good most of the time.

Dec. 13th.—Dr. Sayre's side extension splint was to-day applied before the class. The posterior sinuses still remain open, though but little pus is discharged when the child is dressed. In every way there has been improvement. Dec. 18th.—Patient able to sit up in a chair.

March 10, 1876.—Posterior sinus yet open, and discharge free. General condition has improved. No splint has been worn for the last ten days. The diseased limb is at least an inch longer than the other. Passive motion made every day.

May 19th.—An abscess deep down, about midway on the outer side of the thigh, was to-day opened by Dr. Sayre, and some ℥ ij. of ill-smelling pus evacuated. Poulticed.

(This was probably due to the wound closing too soon, tent not having been sufficiently pressed in.—SAYRE.)

Since this date child has been in the hospital, and but little attention has been paid to it beyond dressing the wound. No splint is worn.

Nov. 1, 1877.—Patient to-day transferred to First Surgical Division, Ward 2. She remains in bed all the time; limbs slightly flexed and adducted. One sinus over left hip out of which some pus escapes. Complains of no pain. Passes urine and fæces in bed.

March 1, 1878.—Child's condition about the same until the last few days. Abscesses have formed occasionally, and been opened. It is noticed that there are two prominences of the spinous processes; one in the upper dorsal region, very sharp, and one in the lumbar region. Child takes large quantities of milk. For the last few days her breathing has been rapid and labored. March 4th.—Child has steadily grown weaker, and this A.M., at 7.30, she *died*.

Autopsy.—Six hours after death, by Dr. Janeway, in presence of Drs. Sayre, Stephen Smith, and Wood. These measurements were made by Dr. Stephen Smith:

Length of body, 30 inches. Left lower extremity, 13 inches in length, from anterior superior spine of ilium to external malleolus. Right limb, 13¼ inches long, between the same points. Length of both limbs from trochanter major to external malleolus, 13½ inches. *Circumference* of body over umbilicus, 40 inches; over false ribs, 20 inches. A *sharp angular projection* observed over third dorsal vertebra, and another not quite so prominent over the first lumbar. *Over left hip* exists the line of an incision, two inches in length, all healed except a minute opening at its upper part. A second cicatrix, 1¼ inches long, on the outer surface of the shaft. Behind, a third incision, which is discharging, a drop or two of serum being squeezed out of it.

As body is placed on its back the left limb becomes straight, and *slight* movement at the hip is noticed.

Body is emaciated, face œdematous, belly markedly protuberant.

On opening the abdomen no ascites is found. Muscles of abdominal wall are flabby. *The liver* projected four inches below free border of ribs; slightly rounded at its right extremity, border sharp in the rest of its extent. Upper border extends to fourth rib. Is waxy, and weighs 2¼ pounds (avoirdupois). *The spleen* projects downwards and towards the median line for two inches. Its upper extremity is curved on itself at right angles to the body of the spleen. Is firm, waxy, and weighs 8 ounces (avoirdupois). *On opening the thorax* the pericardium is found to contain a small quantity of serum.

The right heart is loaded with clotted blood; the left heart is contracted and nearly empty. The clots are soft and fibrinous, most elastic in the right ventricle; there are a few in the right auricle. The foramen ovale is closed. Valves normal. Weight of heart 8 ounces (avoirdupois). *The left pleura* is coated with recent fibrinous exudations; pleural cavity contains a small amount of serum. Calcareous matter is found in the pleura, and more escapes from the posterior border of the lung on section, being the result of an old abscess. Hepatization of the upper and back part of the left lung. *In right lung* apex is adherent. In it is found a cretaceous mass, one inch in diameter, with some cheesy matter. Rest of lung healthy.

Left kidney markedly waxy, especially in the pyramids. Interstitial changes beginning. *Right kidney* also waxy. Both enlarged. Weight of both, 5 ounces (avoirdupois). *Right supra-renal capsule* contained a clot of blood. *Mesenteric glands* enlarged and cheesy. A cretaceous deposit in most of them. Slight waxy changes in *intestines*.

Spinal column, pelvis, and upper half of both femurs removed *en masse*.

Left hip covered by thick mass of fat. A transverse section of left hip made through joint. Upper end of femur found to rest in old acetabulum, and to be united to it by a mass of vascular and apparently fibrous tissue, which admits of considerable movement. A probe can be passed from the posterior sinus down to this mass. This is the only sinus left. No carious bone found.

Reporter S. R. Morrow, Jr., M.D., assistant.

After death Mr. Mason took the accompanying photographs by simply suspending her in a head-rest. It will be observed that the limbs are nearly normal in position, and they assumed this position by their own gravity, without any extension or traction being applied to them. The limb operated upon is in fact the straighter of the two, and not so much flexed at either knee or hip as the other. A sharp, angular projection is distinct over the third dorsal, and another, not so prominent, on the first lumbar vertebræ, and the enormous abdomen is markedly conspicuous.

DR. BRIDDON referred to the case of a little child in the Presbyterian Hospital, who, for a long time after the operation of exsection had been performed upon him, was in an almost hopeless condition. The operation had been performed as a last resort, waxy liver being present at the time. Since then the sinuses had been closing, the child had become ruddy, the legs well developed, and the liver decreased in size.

DR. SAYRE asked Dr. Briddon if he did not think the child would have escaped the waxy liver if the operation had been performed a year earlier.

DR. BRIDDON replied that at such time the child had no hip disease.

Remarks were made by Drs. Mason and Janeway concerning the advisability of the operation; after which the Society went into Executive Session.

Correspondence.

HYPOPHOSPHITE OF ZINC.

A NEW REMEDY.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—This salt has never, so far as I can learn, been used internally for medicinal purposes, and the object of this paper is to explain its peculiar advantages and to call professional attention to it.

The only combination of phosphorus and zinc heretofore used is the phosphide of zinc. The formula for this, as given in Soubeiran's work as recently revised by Regnault, is PZn_3. This shows it to consist of phosphorus and metallic zinc in the proportion of one part of the first to about six parts of the latter, and both unoxidized. As no oxygen enters into its combination, the phosphorus produces the same irritant effect in the stomach as if given in the free state, its irritant action being caused by its oxidation.

The ordinary dose of phosphide of zinc is one-tenth grain. This quantity cannot be largely increased. The proportion of zinc contained in this quantity is too infinitesimal to prove a very powerful nervous tonic, while the proportion of phosphorus is still less.

I therefore propose the use of hypophosphite of zinc. The formula for this is (ZnO, 6HO, PO) (O=8).

In this salt both the zinc and phosphorus are in a protoxidized state, in which condition the phosphorus is rendered non-irritant, admitting the use of such quantities as to fully meet all indications for either phosphorus or zinc. The salt being perfectly soluble, is at once assimilated, while both elements in the phosphide must be oxidized previous to assimilation. Its advantage in most nervous diseases over zinc oxide, zinc sulphate, etc., being that the very desirable effects of phosphorus in its best condition for assimilative action are also available by its use.

The condition of absolute purity is essential to this, as to all hypophosphite salts, for unless used in this condition their therapeutic effect is either very much impaired or wholly lost.

I recommend the use of the syrup, as the sugar is a most efficient preserver against atmospheric influence, and renders the preparation more palatable, though the salt has scarcely any taste, at first, a slight metallic after-taste being perceptible.

It is prepared in the form of syrup, eight grains of the salt to one fluid ounce, of which a teaspoonful (one grain) is the usual dose, and may probably be given in twice or thrice that quantity three times a day.

The salt used is purified and neutral. It has been therapeutically tested with very satisfactory results.

I am, respectfully,

ROBERT W. GARDNER.

170 WILLIAM STREET, NEW YORK.

VAGINISMUS *vs.* INSANITY.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—Without discussing the pathology or determining whether hyperæsthesia of the female sexual organs ends always in vaginismus or not, I desire that the following report should go on record as showing the evil of a diagnosis so nearly fatal to the mental

welfare of the patient, as happened in the present case:

April 2, 1875.—Miss J., age 38. Nervous temperament. Began menstruating at 15, with previous good health. Until six years ago menstruation accompanied with slight pelvic pains directly preceding and during the first day of flow. From this date (1869) dysmenorrhœa greatly intensified and continuing throughout the catamenial flux, with more or less pelvic distress during the entire intermenstrual period.

Under the aggravated influence of her local symptoms Miss J., instead of her usually cheerful disposition, became alternately fretful and gloomy, her melancholy being accompanied with frequent fits of weeping and a deep dislike for social intercourse and family conversation.

Familiar with the above symptoms, but without inquiry or examination of the pelvic organs, Miss J.'s "family physician" unhesitatingly diagnosed (?) her disease "a clear case of insanity," urging that the *poor lunatic* be immediately removed to an insane asylum.

It was during the preparatory arrangements for such removal that I learned so much of Miss J.'s history as above related, and suspicious of what the cause of her affection might be, I advised, and with the family approval, proceeded to make an examination of her case with the following results:

First—The patient unanæsthetized. External organs of generation well developed and seemingly healthy. Attempting a digital exploration, however, the lightest touch induced such extreme pain as to throw the patient into a severe fit of nervous agitation, followed by prolonged shivering and an uncontrollable weeping.

Separating the labia, not the smallest aperture was discernible, nor could a uterine probe of the least calibre be passed into either the *rectum* or vagina, so firm, unyielding, and excessively distressful was the spasm of the sphincter-vaginæ and *rectal* muscles.

Second — The patient thoroughly chloroformed. With surprise to all present, the muscles completely relaxed, and a Sims large-size speculum freely entered a roomy and perfectly healthy vagina.

The cervix, like that of a virgin, small circular os, healthy, and free from all discharge. The uterus correctly placed, freely movable, and of normal size and consistency. Cavity closed, barely admitting the smallest probe, and measuring two and a quarter inches.

Advising an operation, and with a favorable prognosis, urged to complete it at once, I proceeded to dissect away the hymen, rupturing with my hands the fourchette, and widely distending the osteum vaginæ; introducing after the operation Sims's largest size hard-rubber dilator, directing that it be worn two hours at a time three times a day for three weeks, and for two weeks longer one hour every second day. With this treatment, and the frequent use of vaginal injections, my patient was discharged at the end of the fifth week, *cured*.

Miss J., visiting my office two weeks ago (thirty-two months after the operation), reports a regular and painless menstruation, freedom from all local trouble, general good health, and a gain of thirty-three pounds in weight since 1875, which, with the fact that I introduce, and enlarge without pain, Cusco's speculum, adds not a little to the emphasis with which she declares herself "the happiest of mortals."

T. Naylor Bradfield, M.D.

106 Halsey Street, Newark, N. J.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from April 21 *to April* 27, 1878.

Head, J. F., Lieut.-Col. and Surgeon. Assigned to duty at Boston, Mass., as Attending Surgeon and Examiner of recruits, and, upon arrival there, to report by letter to the Com'd'g General, Div. of the Atlantic. S. O. 85, A. G. O., April 20, 1878.

Hammond, J. F. Lieut. Col. and Surgeon. Assigned to duty as Post Surgeon at Fort Adams, R. I., relieving Surgeon Campbell. S. O. 71, Dept. of the East, April 24, 1878.

Campbell, J., Lieut.-Col. and Surgeon. Relieved from duty in Dept. of the East, and to report in person to the Com'd'g Officer, Dept. of the South, for duty as Medical Director of that Department, relieving Surgeon Head. S. O. 85, C. S., A. G. O.

Alexander, R. H., Major and Surgeon. Having relinquished the unexpired portion of his leave of absence, to report in person to Com'd'g General, Dept. of the East, for assignment to duty. S. O. 58, C. S., A. G. O. And assigned to duty as Post Surgeon, at Fort Trumbull, Conn. S. O. 71, C. S., Dept. of the East.

Loring, L. Y., Capt. and Asst. Surgeon. Assigned to duty at St. Louis Barracks, Mo. S. O. 85, C. S., A. G. O.

Buell, J. W., 1st Lieut. and Asst. Surgeon. Relieved from duty in Dept. of Texas. S. O. 86, A. G. O., April 22, 1878.

Medical Items and News.

Abuse of Medical Charities.—Copy of preambles and resolutions offered as portion of a report from the Committee on Abuses of Medical Charities to the New York County Medical Society:

Whereas, The dispensary and hospital service is provided for the pauper population of this city, but is shared by another class without proper limit; and

Whereas, Those arms of this service which maintain shelter, sustenance, and attendance for the out- and in-patient, from steward to scrub-woman, are paid for their labor; and

Whereas, There is now much actual suffering for the necessaries of life in the ranks of the medical profession, which may be partly charged to the plan now common for the physician and surgeon to give gratuitously what is paid for in other departments; and

Whereas, The knowledge of these facts is exceedingly limited or persistently ignored in the body of the profession, and should be clearly and widely made known; therefore, be it

Resolved, That this New York County Medical Society, in the name and on the behalf of the entire profession,

call upon the proper bodies to enact, and the proper officials to faithfully execute, such laws and rules as shall discriminate against the giving relief to any except such as are examined and found to be absolutely without means to pay for such service, and that upon presenting a proper "certificate" duly issued by some person or persons to be designated.

Resolved, That from this date the practice of gratuitous professional serving in charitable institutions leads to professional poverty, is counted unbusinesslike, and is held as odious before the eyes of the fraternity, and that after the fourth day of July, 1878, it shall be considered as sufficient cause for disfellowship.

Resolved, That an address setting forth these abuses be prepared, printed, and circulated amongst the entire profession, City and State, at the expense of this County Medical Society.

GEO. H. MITCHELL, *Chairman.*

E. S. BATES, *Secretary.*

J. C. Peters, Pres. County Medical Society, and Committee on Ethics, etc., etc., F. H. Hamilton, D. B. St. J. Roosa, M. S. Buttles, A. S. Hunter, W. T. White.

HARTFORD COUNTY MEDICAL SOCIETY, CONN.—At the annual meeting of the Hartford County Medical Society Dr. W. A. M. Wainwright was elected President, and Dr. C. W. Chamberlain Clerk for the ensuing year.

MEDICAL SOCIETY OF NEW JERSEY.—The annual meeting of the Medical Society of New Jersey will be held in the Monmouth House, Spring Lake, on Tuesday, May 28th, at half-past seven P.M., and will continue in session the following day.

WM. PIERSON, Jr., *Sec'y.*

PRIZE OF ALUMNI ASSOCIATION OF COLLEGE OF PHYSICIANS AND SURGEONS.—The Alumni Association of the College of Physicians and Surgeons in the City of New York offer for the following year a prize of five hundred dollars, open for competition to all alumni of the college. It will be awarded to the best *medical essay* submitted, if deemed sufficiently meritorious, upon any subject which the writer may select. The essay, in order to compete, must be based upon *original investigations.* Each essay must be marked with a device or motto, and accompanied by a sealed envelope similarly marked, containing the name and address of the author. Essays must be submitted to the Prize Committee on or before February 15, 1879. The committee consists of Drs. Henry B. Sands, Wm. H. Draper, and Frank E. Beckwith. Essays may be sent directly to any of the committee, or care of the Secretary of the college.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.—At a stated meeting held April 22, 1878, it was voted to grant certificates of membership to Drs. A. E. McDonald, R. A. Murray, C. Hitchcock, J. Hadden, G. L. Peabody, and E. S. Bates.

FRIENDLY PROFESSIONAL VISITS.—Mr. Liston was once asked by a patient to take part in a hunting excursion with the hounds in a northern county; he complied. His opinion was asked in regard to a certain case: he advised amputation of a limb, performed amputation in his usual masterly manner, and—was reminded, when he claimed his fee, he was regarded "merely as a friend." Liston said to us, "I will never again accept an invitation to be mounted 'as a friend.'" Radcliffe tells us that on one occasion a miserly old merchant attempted to steal his opinion with regard to his own case. "What shall I do?" said the patient to him. "Why, sir, I should advise you to take advice"—a very proper response to the would-be-pauper patient. The lawyers are shrewder than we are in these matters. Mr. Fazarkley was once asked by one of his hunting friends what he would do under certain circumstances. "I think," said he to the inquiry, "I should defend the action." The action was defended, and defendant mulcted in damages and costs. "I lost my cause," said his hunting friend to Mr. Fazarkley, "by acting upon your opinion." "I don't recollect it," said Fazarkley. The vanquished defendant thereupon replied, "You gave me that opinion when we were riding together to meet the Pytchley hounds." "Oh!" said Fazarkley, "that was my *travelling*, not my *professional* opinion." It is scarcely necessary, we think, to draw a moral from these facts.

DR. MONTEFIORE J. MOSES died at his home in this city on April 11, 1878, of Bright's disease. Dr. Moses was born in Charleston, South Carolina, July 20, 1841. His family removed to New York soon after, so that Dr. Moses' boyhood was passed in this city. In 1854 he returned to Charleston and studied medicine for two years. He entered the University Medical College of this city in 1856, and graduated in 1861, taking one of the Valentine Mott medals. At the breaking out of the rebellion he entered the Second Georgia Regiment and served for fifteen months as a private soldier. He afterwards served as surgeon of the regiment and as medical officer in a post hospital in Enterprise, Miss. Still later he was surgeon of the Thirty-seventh Mississippi Regiment until the close of the war. In 1863, he married Miss Jonas, of Columbus, Georgia. In 1869 he entered upon the practice of medicine in New York, where he remained until his death. Dr. Moses was a gentleman of exceedingly pleasing address and fine professional and scholarly attainments, as well as of the most exemplary character. He had acquired a large private practice, and had fully entered upon a successful and honorable career. His wife and three children survive him.

THE LATE SETH SHOVE, M.D.—At a regular meeting of the Croton Medical and Surgical Union held at Katonah, Westchester County, N. Y., April 2, 1878, the following resolutions were adopted:

Whereas, We have learned with profound sorrow of the death of Dr. Seth Shove; and

Whereas, It is our sad duty to testify to the great loss sustained by us in his death; and

Whereas, It is becoming and proper that we should bear public testimony to his excellence of character and to his high professional attainments; therefore, be it

Resolved, That in the death of Dr. Shove this Society, of which he was an honored and efficient member, has sustained a loss which is irreparable.

Resolved, That we bear witness to his superior talents, his cultivated mind, his kind heart, his sympathizing nature, and his high sense of professional honor.

Resolved, That in his varied learning, his ripe professional experience, and his wise counsels, we recognize the qualities that constitute the highest type of a physician and the best guarantees for the professional success which crowned his career.

Resolved, That we shall ever cherish his noble example as a man, his enviable reputation as a physician, and his endearing qualities as a friend.

Resolved, That we sympathize with his family in this their overwhelming sorrow.

Resolved, That a copy of these resolutions be sent to

the family of the deceased, and that it also be published in THE MEDICAL RECORD and the local papers.

J. Q. ADAMS, M.D.,
J. H. SMITH, M.D., } *Committee.*
L. F. PELTON, M.D.,

DR. W. H. B. POST has retired from partnership with Dr. E. C. Mann in the management of the Sunnyside Medical Retreat at Washington Heights, N. Y.

AMERICAN MEDICAL COLLEGE ASSOCIATION.—At the recent meeting of the Tennessee State Society the following was unanimously adopted:

Whereas, An association has been formed looking to the advancement of medical education in the United States, and the establishment of a common policy among medical colleges in the more important matters of college management, under the name of the American Medical College Association; and

Whereas, Such Association has entered into articles of confederation to this end; and

Whereas, The action of said Association has been indorsed by the American Medical Association; therefore, be it

Resolved, That we congratulate the profession upon this step in the right direction in maintaining and elevating its honor and dignity, and cordially approve and indorse said action.

CRIMINAL NEGLIGENCE ON THE PART OF A DRUGGIST.—Another druggist has come to grief in France, this time in Paris. A bottle of syrup of buckthorn had been ordered for a girl aged fourteen years, but the pharmacist, M. Champion, gave instead of it a bottle of chloroform. A dose of this was administered to the patient, who almost immediately fell into a stupor, followed by delirium, and soon expired, after intense suffering. The autopsy showed that death was due to the absorption of the chloroform. At the trial the pharmacist put in the plea that the mistake was made by the messenger, who took the wrong bottle from the counter. This assertion was refuted, however, and a witness testified to the fact that the defendant had committed other mistakes, though fortunately they were of a less dangerous character. The trial ended in the conviction of the accused, who was condemned to pay a fine of 200 frs., and, in addition, 1,500 frs damages to the mother of the victim.

TYPHUS IN ST. PETERSBURG.—An epidemic of typhus, which counts four hundred victims per week, is raging in St. Petersburg. The disease was brought from Armenia by the Turkish prisoners and the Russian soldiers. The sanitary condition of the Transcaucasus at the present time is exceedingly bad; Generals Chelkoviskow and Goubski have already succumbed to the plague, and General Heimann is dangerously ill. It is claimed that this state of affairs is the fruit of gross negligence and disregard of hygienic rules in the army of the Caucasus.

POPULATION OF SAXONY.—Saxony, which is now proportionally as populous as Belgium, if not more so, is one of the countries of Europe in which the increase in population has been most rapid of late years. In 1834 the kingdom had 1,595,668 inhabitants, and in 1875 the number had increased to 2,760,586. The increase was due, in a large measure, to immigration, as Saxony has become one of the most active manufacturing countries in the universe. The greater part of the increase has been in the cities, the chief of which are Dresden, Leipsic, and Chemnitz. Dresden, in 1834, had 66,000 inhabitants; now, with its suburbs, it has 244,000. Leipsic, in 1834, had 45,000, and in 1875, 213,000. Chemnitz, in 1834, had 21,000, and in 1875, 114,000.

ALABAMA STATE MEDICAL CONVENTION.—The annual convention of this body was held at Eufaula, Alabama, April 11th and 12th.

PRURITUS VULVÆ.—Duhring, in his late work on skin affections, mentions most favorably camphor, chloral, and borax, variously combined:

℞. Chloral..... grs. x to xxx.
Water..... ʒi.

Used as a lotion to the parts:

℞. Boracis..... ʒiv.
Morphiæ sulphatis..... gr. viij.
Glycerine..... ʒss.
Aquæ..... ʒviiss.
M.

These preparations, a little weakened, may be used by injection. For this purpose the following has been found highly efficacious:

℞. Nitrate of alumina..... ʒi.
Aquæ..... ʒi.
M.

As an ointment the following is strongly recommended:

℞. Campho æ,
Chloralis hydratis..... aā ʒi.
Ungt. aquæ rosæ..... ʒi.
M.

THE PHARMACEUTICAL ASSOCIATION OF GEORGIA met in Augusta, April 9th.

THE NATIONAL QUARANTINE BILL, which we recently took occasion to endorse, has now become a law. The Supervising Surgeon-General of the Marine Hospital Service is charged with its enforcement.

BROMIDROSIS.—A solution of common soda freely applied will often remove bromidrosis from the feet and axilla.

NITRO-MURIATIC ACID should always be prescribed by itself, otherwise explosions are liable to occur.

THERMO-CAUTERY AND ETHER.—When employing thermo-cautery, chloroform should be used as the anæsthetic instead of ether, the latter being liable to ignition and explosion.

LISTER'S METHOD, BURSTING OF A BOILER OF THE SPRAY APPARATUS.—Recently, at an operation in this city, the boiler of the spray apparatus exploded, and before the bystanders recovered their composure the bacteria seized their opportunity and entered the wound in force. No one was injured, and the fact that the wound is now healing by second intention is conclusive proof of the value of the antiseptic process properly carried out. The orifice of the safety-valve was found to be entirely free from bacterial deposits, and except for the fact that the valve itself would not work the apparatus was perfect.

ANTI-VACCINATION.—An Englishman has been fined on twenty-five different occasions for refusing to allow his child to be vaccinated. An English paper very properly indorses the action of the authorities, maintaining that toleration does not apply to the preparation of the soil for an epidemic of small-pox.

AMERICAN MEDICAL ASSOCIATION.—The twenty-ninth Annual Session will be held in the city of Buffalo, N. Y., on Tuesday, Wednesday, Thursday, and Friday, June 4, 5, 6, and 7, 1878, commencing on Tuesday at 11 A.M. "The delegates shall receive their appointment from permanently organized State Medical Societies, and such County and District Medical Societies as are recognized by *representation in*

their respective State Societies, and from the Medical Department of the Army and Navy of the United States." "Each State, County, and District Medical Society entitled to representation shall have the privilege of sending to the Association one delegate for every ten of its regular resident members, and one for every additional fraction of more than half that number: *Provided*, however, that the number of delegates for any particular State, Territory, county, city, or town shall not exceed the ratio of one in ten of the resident physicians who may have signed the Code of Ethics of the Association."

THE LATE DR. NATHAN R. SMITH, OF BALTIMORE.—Prof. S. C. Chew, M.D., of the University of Maryland, delivered a very interesting and scholarly address, commemorative of Prof. Smith, before the Alumni Association of the University, March 1, 1878.

PRIORITY OF THE METHOD OF SUSPENSION IN THE TREATMENT OF SPINAL DISEASES.—Dr. C. T. Hunter, of Philadelphia, sends the following note to Dr. L. A. Sayre, of this city. For the present, and perhaps until Hippocrates or Galen are heard from, a very important question of priority seems to be settled:

"MY DEAR DOCTOR:—When your son was here, two or three weeks ago, I told him that Dr. Ashhurst had found a reference to suspension of the body in spinal disease, and I promised to send it to you as soon as I should be able to find it. The book is entitled 'A Treatise of the Rickets: being a Disease common to Children, wherein (among many other things) is showed: 1 the Essence, 2 the Causes, 3 the Signs, 4 the Remedies of the Disease.' By Francis Glisson, George Bate, and Ahasuerus Regemarter, Fellows of the College of Physicians, London. Printed by John Streater in 1668.

"I enclose a copy of the extract, as I don't think that you will be able to find the book in New York.

"*Extract from Glisson on Rickets, p.* 363. 'The artificial suspension of the Body is performed by the help of an Instrument cunningly made with Swathing-Bands, first crossing the Breast and coming under the armpits, then about the Head and under the Chin, and then receiving the Hands by two handles, so that it is a pleasure to see the Child hanging pendulous in the Air, and moved to and fro by the spectators. This kind of Exercise is thought to be many waies (ways) conducible in this Affect, for it helpeth to restore the Crooked Bones, to erect the bended Joynts, and to lengthen the short Stature of the Body. Moreover, it exciteth the vital Heat, and withall alureth a plentiful distribution of the Nourishment to the external and first affected parts; and in the meantime it is rather a pleasure than a trouble to the Child. Some, that the parts may the more be stretched, hang Leaden Shooes upon the Feet, and fasten weights to the Body, that the parts may the more easily be extended to an equal length. But this exercise is only proper for those that are strong.'

"This work on Rickets belongs to the Pennsylvania Hospital Library."

MONUMENT TO CLAUDE BERNARD.—A subscription is open in the Paris medical journals for a monument to Claude Bernard. As French physicians have not alone been enlightened by his discoveries, and as Americans are as largely indebted to him as any others, it would appear to be eminently proper that a subscription list should be started in this country.

THE NEW YORK OPHTHALMIC AND AURAL INSTITUTE treated during the last year 4,460 new patients, viz, 3,629 for diseases of the eye, and 831 for diseases of the ear. As inmates, 308 patients were treated, receiving an aggregate maintenance of 7,210 days, showing a daily average of 19¾ inmates. The number of more important operations was 397, among which 54 for primary cataract (51 successful), 46, iridectomies, 127, squint operations.

From the time when the institution was opened, in May, 1869, to the 31st of December, 1877, it treated 32,651 patients gratuitously in its dispensary, 2,513 in the house, and performed 3,484 operations.

As a *school of Ophthalmology and Otology*, the institution has annually given, during the last years, two regular and systematic courses of instruction in all branches of the above specialties.

The surgical staff consisted of Drs. H. Knapp, T. R. Pooley, E. Grüning, A. Alt, C. Williams, P. J. Dills, F. C. Valentine, R. O. Born, and Bettmann.

CASE OF BLOOD-POISONING BY RED STOCKINGS.—A peculiar case of blood-poisoning has recently been reported from Coburg. A woman, after receiving an injury on the shin, put on a pair of red woollen stockings, which came in direct contact with the wound. This rapidly assumed an unhealthy aspect, and symptoms of general blood-poisoning by the *aniline*, with which the stockings were colored, soon set in. The case terminated fatally ten days afterwards.

DEATH FROM CRIMINAL MALPRACTICE.—A railway signal-man in Stahnsdorf, Prussia, who enjoys the reputation of a great medicine-man, was recently called to attend a peasant woman for an ulcer. The treatment consisted in free incisions, as a result of which the patient was seized with tetanus, which terminated fatally. The operator was arrested, tried, and condemned to a year's imprisonment.

INFRANGIBLE GLASS.—Two instances of explosion of the so-called infrangible or flexible glass have recently been reported in Germany. In one case a tumbler made from this glass, which had been repeatedly filled with tea, suddenly broke into splinters with a violent explosion, while being raised to the mouth. The splinters flew all over the room, some of them striking the ceiling, and others cutting the hands and faces of persons sitting near.

In the other case, two of the flexible glasses had been bought in the afternoon, and to prove their infrangibility, repeatedly allowed to fall from the table to the floor. In the evening they were filled with beer and left on the table. About five minutes afterwards a sudden detonation as loud as a pistol shot was heard, and a thousand minute bits of glass flew over the table in every direction. Very few of the splinters were of any size. One of the two glasses had exploded while standing perfectly free and undisturbed on the table. On examination of the splinters it was found that the bottom of the glass in particular was broken into small square pieces, which had lost their usual solidity, and could easily be crumbled between the fingers. It was then remembered that the under part of the bottom of the broken glass had been remarkably rough and uneven, while the other glass was quite smooth. Numerous experiments were then made with this second glass; it was filled with different fluids, struck, allowed to fall, etc., but no explosion occurred. The cause of these dangerous explosions remains as yet enveloped in mystery. Whatever it may be, however, the above facts demonstrate the necessity of caution in the use of flexible glass, as an explosion during the act of drinking would be liable to cause serious injury to the face, and more particularly to the eyes.

THE YEAR 1877, NOW COMPLETE, COMPRISES

I.—THE SECOND VOLUME OF SMELLIE'S MIDWIFERY. Edited and annotated by Dr. McClintock of Dublin.

II.—THE MEDICAL DIGEST. By Dr. N. Neale. This work consists of carefully classified references to the contents of the chief London Medical Journals during the last thirty years.

III.—THE SECOND AND CONCLUDING VOLUME OF PROF. BILLROTH'S LECTURES ON SURGICAL PATHOLOGY AND THERAPEUTICS, with Index.

IV.—THE FIRST FASCICULUS OF AN ATLAS OF PATHOLOGY. Compiled for the Society from original sources, by a Committee consisting of Dr. Gee, Dr. Green, Dr. Moxon, Dr. Sutton, Mr. Holmes and Mr. Hutchinson, with descriptive letterpress.

The Series for 1878 will probably comprise the following, but it must be understood that the Council is not pledged as regards this announcement:

I.—BIBLIOTHECA THERAPEUTICA. By Dr. Waring. Vol. I. Nearly Ready.

II.—A SECOND VOLUME OF DR. LATHAM'S WORKS. Collected and Edited for the Society by Dr. Robert Martin. The first volume of this work was issued in 1875, but new members who join from the year 1876 will be allowed to obtain it separately, in order to complete their sets. (Price Five Shillings.)

III.—A FIRST PART OF MAYNE'S LEXICON OF MEDICAL TERMS. This work will be edited and wholly re-written for the Society by Mr. Henry Power and Dr. Leonard Sedgwick. The copyright of the original work has been purchased by the Society, and it will in future be obtained only by its members. The Society's edition will be so much remodelled and enlarged that it will constitute almost a new work.

IV.—THE THIRD VOLUME OF SMELLIE'S MIDWIFERY. Edited by Dr. McClintock.

V.—A SECOND FASCICULUS OF THE ATLAS OF PATHOLOGY. This fasciculus will conclude Diseases of Kidneys and probably complete Diseases of the Spleen and Supra-renal Glands. It will be accompanied by a short *of resumé* the present knowledge of the Pathology of Kidney Disease. By Dr. Greenfield. With illustrations from the microscope.

Annual Subscription, $10. Payable in advance.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK'S preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing-Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain; Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil.

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This Animal Vaccine can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

FRANK P. FOSTER, M.D.

We have an arrangement with Dr. Foster by which we receive this Vaccine *fresh daily.*
By this arrangement all supplied by us *is absolutely fresh.*
We can furnish it in any quantity desired, either by express, or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified indorsement of the medical profession of New York

QUILL SLIPS (half quill, charged on convex surface, at square-cut end),	$0.25
CAPILLARY TUBES, ...	2.00

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

Analyses of Sulphate of Quinine Pills.

As we have repeatedly notified the trade, our Sulphate of Quinine Pills are made of Bleached Quinine and contain the correct amount of Quinine Sulphas, as represented on the label.

We submit below three analyses of our Sulphate of Quinine Pills obtained at different druggists; the first was made by Mr. Chas. Rice, of New York, one of the editors of the "*New Remedies*," and chemist of Department Public Charities and Correction of New York City, who is well known both personally and by reputation by a large number of physicians and druggists throughout the country. The other two analyses are by Dr. Polenske, former assistant of Prof. Sonnenshein, of Berlin, and now our own analytical chemist.

Our "Hospital Quinine" Pills are made as set forth in our circular of March 27th, which we reprint for the information of those who may not have seen it before.

With the assurance to the trade and medical profession, that we will always manufacture our preparations, as we have in the past, in **perfect good faith,** that we will use the best materials obtainable, increasing our knowledge by every means in our power, for examining and testing all ingredients and perfecting our business, we remain,

Very respectfully, **McKESSON & ROBBINS.**

NEW YORK, APRIL 17th, 1878.

"Messrs. McKESSON & ROBBINS,

Gentlemen:—Having been requested by you to make an assay of the alkaloids contained in your Gelatine-Coated Quinine Pills, I purchased an original vial, containing 100 2 grain pills, in the store of Mr. Theodore Cole, 409 First Avenue, New York. Each ten of these pills weighed very nearly 84 grains, and the weight of the single pills is very uniform, varying but slightly either way from 8.4 grains. The whole number of pills, (100,) yielded 143.385 grains of anhydrous alkaloid, which was found to be **pure, White Quinia**, free from other cinchona alkaloids. This amount of dry Quinia corresponds to **803.8 grains of Sulphate of Quinia**, containing 8 molecules of water of crystallization ($2\,C_{20}\,H_{24}\,N_2\,O_2 \cdot H_2\,SO_4 + 8\,H_2\,O$); or to **901.7 grains of Sulphate of Quinia**, containing 7½ molecules of water of crystallization ($2\,C_{20}\,H_{24}\,N_2\,O_2 \cdot H_2\,SO_4 + 7½\,H_2\,O$), which latter is, as near as possible, the formula of the commercial pure Sulphate of Quinia. The amount of Sulphate of Quinia contained in the 100 pills examined, is therefore a trifle **in excess** of the required quantity, (3.8 grains, or 1.7 grain, according to whatever formula may be adopted for the crystallized salt).

Respectfully, CHARLES RICE,
Chemist, Bellevue Hospital, N. Y."

NEW YORK, MARCH 30th, 1878.

"I have analyzed McKesson & Robbins' Gelatine-Coated 5 grs. Sulphate of Quinine Pills, from an original bottle of one hundred, and find that in two analyses of 10 pills each, the result in both cases was 51 grains of pure Sulphate of Quinine.

ED. POLENSKE, Ph. D."

NEW YORK, APRIL 13th, 1878.

"One hundred McKesson & Robbins' Gelatine-Coated 2 grs. Sulphate of Quinine Pills, analyzed by me to-day, contained 198 grains of Sulphate of Quinine. The Sulphate of Quinine obtained from these pills stood the Ether test, as laid down in the U. S. Ph.

ED. POLENSKE, Ph. D."

Circular of March 27th, 1878.

Since we changed, last fall, from Unbleached to Bleached Quinine in the manufacture of our Pills, we have heard from a large number of druggists and physicians stating that the therapeutical effects of the dark pills were better than the "bleached," dose for dose, where a tonic was indicated, and the antiperiodic effects of the former were as well marked. We made the change because we were disappointed in obtaining a uniform article of unbleached Quinine, were deceived in two shipments we received and the analyses of samples from the same package we submitted to different highly reputable chemists varied surprisingly, in fact, analysing Quinine *quantitively* is very difficult, as it depends very largely upon the different solubilities of the alkaloids in water, while the *qualitative* analysis is very simple and reliable.

The curative properties of the other alkaloids of Cinchona Barks have been well attested and the effect of the **combined alkaloids** has been repeatedly asserted to be greater than that of any **one alone.**

In view of these facts, we accordingly propose to offer Pills made of Hospital Quinine, which differs from that which has been known and understood as "unbleached," in the process of manufacture and in the proportion of Quinine. This Hospital Quinine will contain about 50 per cent. of Quinine Sulphate, and the balance, Cinchonidia Sulphate and traces of Quinidia Sulphate; the Cinchonia Sulphate, being less powerful than the other alkaloids is separated.

These pills on account of their lower price will relieve a difficulty, to which a large number of people living in malarious districts have been subjected—the inability to purchase Quinine Pills on account of price, especially when scarcity causes sudden and great advances, as at present—at the same time we believe that confidence may be felt in experiencing equal relief with similar doses.

We will continue, as now, to make our "Quinine Pills" of bleached Quinine, and the white color will readily identify them from our darker Hospital Quinines, which will be labelled "Hospital Quinine." The list of Hospital Quinine Pills we submit below is subject to same discount as our other pills, and will be reduced as soon as the market on Quinine will allow. We call special attention to our Pills of Cinchona Bark Alkaloids, which contain a definite quantity of each of the four alkaloids, one-half grain each Sulphates Quinia, Quinidia, Cinchonia and Cinchonidia.

We annex below list of our Pills of other Cinchona Alkaloids, and remain, soliciting your correspondence and valued orders,

Yours respectfully,

March 27th, 1878. McKESSON & ROBBINS.

Disinfectants.

The lively discussion that has recently taken place on the question of noxious sewer gases and their effect upon the health of the City, has served to direct attention to the use of disinfectants, and several articles have been brought to the notice of the public. One of these is the Girondin Disinfectant, introduced here by Park & Tilford. and warmly commended by Dr. Moreau Morris, by whom it was subjected to severe tests while he was City Sanitary Inspector and Superintendent. The results of these tests were satisfactory, especially when this disinfectant was placed in comparison with other articles submitted to analysis. Dr. Morris says the Girondin Disinfectant is a preparation "made upon thoroughly scientific principles, is a combination of well-tried materials, and is so certain in its effects through these combinations that it will not only almost instantly deoderize all offensive exhalations, but utterly destroy all the infective properties of decomposition, which it does by the instant arrest of all fermentative processes permanently and absolutely. Commercial rivalry, or, perhaps prejudice, has operated as a bar to its use by the public, and hitherto its cost also entered into the element of its more general uses, but the latter objection has now been removed, so that it may be obtained at a very cheap rate. It has received since its first introduction to the Board of Health in 1871, from year to year, until now, the unqualified approval of official sanitarians, practical surgeons, physicians, and hospital managers."

Please mention MEDICAL RECORD. **PARK & TILFORD, cor. Broadway and 21st St., N. Y.**

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HÆMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

MEDICATED DISCS

FOR HYPODERMIC INJECTION.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally that the great demand which has arisen for their **GELATINE PREPARATIONS**, since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS**, and for **OPHTHALMIC PURPOSES**, as well as the **LAMELS FOR INTERNAL USE**, will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 NEW BOND STREET, LONDON, ENGLAND.

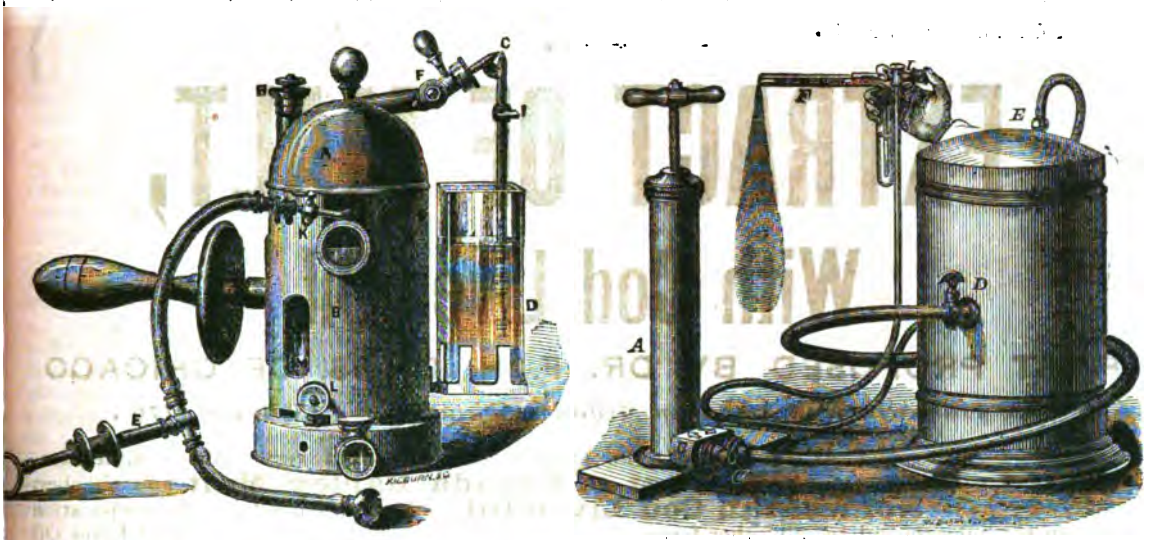
THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

PRICES REDUCED.

The Complete Atomizer	**$5.00**	**Clarke's Atomizer**	**$3.00**

CODMAN & SHURTLEFF,

MAKERS AND IMPORTERS OF SUPERIOR SURGICAL INSTRUMENTS,

13 & 15 Tremont Street, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case.....$9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case.....$8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

What will the Weather be To-morrow?

POOL'S SIGNAL SERVICE BAROMETER,

Or Storm Glass and Thermometer Combined

WILL TELL YOU!

It will detect and indicate correctly any change in the weather 12 to 48 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators. Farmers can plan their work according to its predictions. It will save fifty times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. We will send it FREE to any address on receipt of **$2.00.** This great WEATHER INDICATOR is endorsed by the most eminent Physicians, Professors, and Scientific men of the day, to be the *BEST IN THE WORLD.*

U.S.N AGENTS WANTED **OVELTY CO**

BEWARE OF IMITATIONS! None genuine without our **Trade-Mark.** Every instrument warranted PERFECT AND RELIABLE. When you order, please state your Post Office address, and mention the name of Express Co., and their nearest office *to your place.* Post Office Money Orders or Registered Letters may be safely sent at OUR RISK. We make good ALL DAMAGE THAT OCCURS BY SHIPPING.

AGENTS WANTED. Send stamp for circular. Exclusive control of territory granted. Manufactured only by the

U. S. NOVELTY COMPANY,

105 Maiden Lane, New York.

LIBERAL DISCOUNT TO THE TRADE.

We clip the following indorsement from the *Cultivator and Country Gentleman*, of Albany, N. Y., May 24, 1877:

A GOOD STORM GLASS.—For the benefit of the readers of the COUNTRY GENTLEMAN, I beg to say that I fully tested, through all the storms of March, one of the U. S. Novelty Co.'s combined barometers and thermometers, and find it in all respects reliable. It tells accurately 24 hours beforehand the approach of violent storms of any kind, and is cheap at $2, and quite a little ornament.

FOOD for INFANTS and INVALIDS

THE

Health Food Company,

74 Fourth Ave., adjoining Stewart's,

NEW YORK,

Would call the attention of the Profession to their

Cold Blast (Attrition) Whole Wheat Flour,

AS AN ADJUNCT IN THE TREATMENT OF

INDIGESTION, CONSTIPATION, and MAL-NUTRITION.

This Flour represents all the Food Elements of the Wheat, the indigestible silex coat being first taken off, and the entire kernel, including the phosphates, etc., being reduced to fine flour by a new process, in which both the admixture of detritus from mill-stones and the injurious effects of heating the flour during preparation, are entirely avoided.

IT IS CHEAPER THAN WHITE FLOUR,

Because it contains nearly four times the amount of the Mineral Substances, for

NOURISHING THE NERVES, BONES, HAIR, AND TEETH.

ATTENTION IS ALSO DIRECTED TO OUR

WHITE WHEAT GLUTEN,

For *diabetes*, and for those requiring the Nitrogenous and Mineral portions of the Wheat, *without starch*. This, like the Whole Wheat Flour, can be made into Bread and Crackers, or may be taken in various ways, and often proves a very valuable remedy for the *Constipation* and *Dyspepsia* associated with many diseases. In excessive fatness, and in disturbed mental states, the Gluten (crude and purified) proves very serviceable.

Circulars, descriptive of these and other Health Foods, mailed to all applicants.

SHEDDEN'S FOODS
FOR THE
DIABETIC AND DYSPEPTIC.

The prepared Flour of Bran, freed from Starch by Gamgee's process, in 10 lb. cases, $5.00. Gluten Flour, rich in nitrogenous matter and the phosphates, in 10 lb. cases, at $3.00.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

BOERICKE & TAFEL'S

LIST OF IMPORTED

Fresh Plant Tinctures

KEPT IN STOCK.

These are prepared exclusively from fresh plants gathered when in their full vigor, thus retaining all volatile constituents usually lost in drying, and utilizing all such juices, which are partly changed or rendered to a more or less degree insoluble by drying.

Medicinal plants growing in this country, we gather ourselves, while of European plants we import the ready-made essences.

These plants are divided into three classes, and the treatment accommodated to their greater or less degree of succulence.

Tinctures according to **Class I** are made by adding one part of the expressed juice of the plant, one part of Alcohol.

Tinctures according to **Class II** are made from three parts of the plant to two parts of Alcohol by weight.

Tinctures according to **Class III** are made from one part of the plant to two parts of Alcohol by weight.

To distinguish these Tinctures from those of the U. S. Pharm., the Greek letter φ (phi is written after their names on the label, and *appended to each bottle is a label giving the proportion of the plant in the tincture.*

These fresh plant tinctures are sold at the following rates, with few exceptions:

1 oz. 25 cts.; 2 oz. 45 cts.; 4 oz. 85 cts.; 8 oz. $1.60; 1 lb. $3 00.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

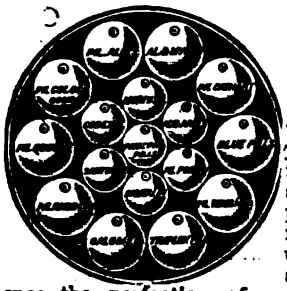
Printed Pills and Granules



These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal: Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

CONCERNING BELLADONNA PLASTER

A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

Dr. J. M. Grosvenor, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affectingthe combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty, as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U. S. P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon-like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonnæ Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J. M. Grosvenor, M.D., (accompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a *cheap* product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicians, if unable to obtain Dr. Grosvenor's Improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., *22 Park Place,* **NEW YORK.** or **GROSVENOR & RICHARDS,** *97 Oliver Street,* **BOSTON.**

RELIABLE ANIMAL VACCINE.

THE undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*

Physicians can obtain the **Animal Vaccine** of MESSRS. CASWELL, HAZARD & Co., Broadway corner 24th Street.

FRANK P. FOSTER, M.D.

By our arrangement with Dr. Foster *all* Vaccine supplied by *us* is *absolutely fresh.*

We can furnish it in any quantity desired, either by express or by mail, if remittance is made to cover postage.

Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified endorsement of the medical profession of New York.

QUILL SLIPS (half quill, charged on convex surface, at square-cut end), 25 cts.
CAPILLARY TUBES, ... $2.00

For ordinary use, *quill slips* are the most reliable of all forms of stored Vaccine, and in cases of failure with them in *primary* vaccination, if used within one week of their issue, and strictly in accordance with the printed directions, *being in the meantime kept cool and dry*, a second supply will be furnished gratis.

Tubes are intended chiefly for transportation to long distances, as the virus is preserved for a considerable length of time. They are superior to crusts, but inferior to quill slips.

Crusts are not recommended, and are not sold, for the reason that, however fresh and however well formed they may be, they are apt to prove inefficient.

CASWELL, HAZARD & CO., New York.

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen: **$10.00** per gross.

Physicians—rare chance—Practice of $20,000 in eight years, averaging $2,500 per annum, and splendid country home, for sale. Price, $3,200; easy terms. The property alone should bring $4,000, but wishing to retire, will sell property and practice at the very moderate sum of $3,200. Address
DR. F. W. VANDERSLOOT, Nittany, Centre Co., Pa.

THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

SEABURY & JOHNSON,

Originators and Manufacturers of

U. S. PHARMACOPŒIA MEDICINAL AND SURGICAL

Plasters POROUS AND SPREAD in Rubber Combination

NEW YORK AND LONDON.

Received highest and only Award (Medal and Special Diploma of Merit) over all Foreign and Home Competitors in 1876.

THE JURORS' AWARD IS SUBSTANTIALLY,

ORIGINALITY.—The successful application of Rubber as a base for all medicinal and mechanical plasters.

RELIABILITY and general excellence of manufactures.

FACTS CONCERNING MEDICINAL PLASTERS IN RUBBER COMBINATION.

Indiarubber-spread and Porous Plasters possess indisputable advantages over all other Plasters: (1) The Rubber Combination preserves the incorporated drug or extract from decomposition or volatilisation; (2) They adhere closer and firmer; (3) They do not soil the skin or linen; (4) They are always pliable, and never become hard or brittle; (5) They adhere without heat or moisture; (6) An increased effect is obtained by being porous, as the Plaster neither slides nor moves from its affixed position.

BELLADONNA PLASTER, U. S. P.

IN RUBBER COMBINATION.

Messrs. SEABURY & JOHNSON claim that theirs is the most thoroughly reliable and only strictly officinal Belladonna Plaster ever offered the medical profession. It is an improvement on other Belladonna Plasters in several important particulars. First, it is incorporated with the officinal alcoholic extract only. Secondly, it is freed from all stimulating qualities, thereby insuring the uninfluenced sedative action of Belladonna. Thirdly, it adheres with greater tenacity than others. Physicians have been prejudiced in favor of Allen's English Extract; but recent analysis, fairly conducted by competent chemists, emphatically condemns the Inspissated Extract as a mild and unstable product, representing but one-half or less than one-half of the strength of the U. S. P. Alcoholic Extract of Belladonna. The following result, published in the *American Journal of Pharmacy*, in April, 1876, page 145 is furnished for your consideration, which indicates the following percentage of Atropia in the respective extracts:

Alcoholic Extract Belladonna, U. S. P.	*2,571*
Allen's English Extract	*1,411*
Herring's English Extract	*1,179*

The practitioner, as well as ourselves, has but one choice.

Considering these features from a professional standpoint, we offer a Belladona Plaster which cannot be improved upon.

SALICYLATED SURGEONS' RUBBER ADHESIVE PLASTER.

This article has met with unprecedented success, and has been emphatically pronounced by our most skilful General and Orthopædic Surgeons, as "the best Surgeons' Adhesive Plaster known". It is applied without heat or moisture, conforms quickly to the parts; is perfectly flexible and waterproof, and is ready for use at any moment. It is free from irritating properties and very healing. In counter-extension it has no equal, as it does not move or slide after being applied. Our India Rubber Adhesive Plaster is also spread on twilled linen, which resists the most powerful strain. In addition to these general improvements, the plaster being impervious to water, wounds can be cleansed without removing the plaster, obviating the necessity of constant redressing, saving labor and time. **Whenever continued powerful adhesion is required, it should be procured in porous form.**

MUSTARD PLASTER (spread on Cotton Cloth).

Our Mustard Plaster is a decided improvement over the best French makes; the mustard is manipulated so as to exclude all the moisture, retaining unimpaired by such treatment its essential properties. They are always reliable, conform quickly to the part, and when thoroughly wet do not break into pieces, as is the case with all other mustard plasters. They do not crack or peel off, and can be removed without soiling the skin or linen. Being **manufactured only of pure mustard,** they are perfectly free from Croton Oil or other dangerous substitutes, often employed to induce intense irritation.

RUBBER BLISTER PLASTER (Camphorated) R. P. STRENGTH.

This article has a splendid reputation; its characteristic action is not impaired by age in any climate. The whole fly is incorporated, which by constant manipulation is thoroughly and beautifully combined with the plaster. **Its properties are developed quicker, and its blisters in less time than the cerate.** It never fails to blister when used as directed. In addition to its superior efficacy as a vesicant, we incorporate a sufficient quantity of Camphor, which, with the Olive Oil, used on the face of the plaster, **prevents Strangury.** This improvement will be appreciated by every practitioner. It is more reliable than any known cantharidal preparation.

CAPSICUM PLASTER.

Recently this article has crept into favor with our most esteemed physicians, and judging from results it is doubtless the best rubefacient known. It has the specific action of mustard without its objections. The characteristic action of Capsicum is uniformly maintained from twenty-four to forty-eight hours, without blistering, being mild, continuous, and stimulating. This plaster is spread in rubber combination and in porous form. Experience has taught practitioners that the Oleo Resin of Capsicum is too violent, frequently vesicating; we incorporate the crude drug in sufficient quantity without risk to the patient. Our Capsicum Plasters will be found more practical for general use than the **so-called Mustard or Capsicum Papers.**

SPECIAL NOTICE TO PHYSICIANS.

Quality is of great importance to the practitioner: by reliable preparations he supplements his own skill. You can therefore rest assured that every article we manufacture is of strict pharmacopœia strength, and incorporated with perfectly reliable Extracts and Drugs, well selected, carefully and conscientiously prepared, and manufactured invariably under the personal superintendence of one of our firm. **Our whole attention and study is devoted entirely to the art of Plaster making,** and we are ready at all times to receive suggestions from the fraternity, which may be of benefit to all.

BELLEVUE HOSPITAL
MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DORSMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	25 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FIFTH ANNUAL ANNOUNCEMENT. (1878-79.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 26th, 1878, and ends the last Wednesday in June, 1879. Persons who hold no degree in arts or science must pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 23d.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. E. H. FITZ, Secretary, 106 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30, 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1878, and continue twenty-six weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.

Phila., 1876. Medal of Merit.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the "***La Plata,***" since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

In corresponding with Advertisers please mention **The Medical Record.**

Warranted that the register of this thermometer will not unite with the mercury in the bulb A.

The advantages this Thermometer possesses over *all others*, consist in the reservoir B, in which the registering part of the mercury is collected, forming a body of oblong shape. The surface of this body being large in comparison to the contracted bore, makes it impossible to unite the register with the mercury in the bulb A.

These Thermometers are well seasoned before graduating, and, consequently, are as correct as they can be made.

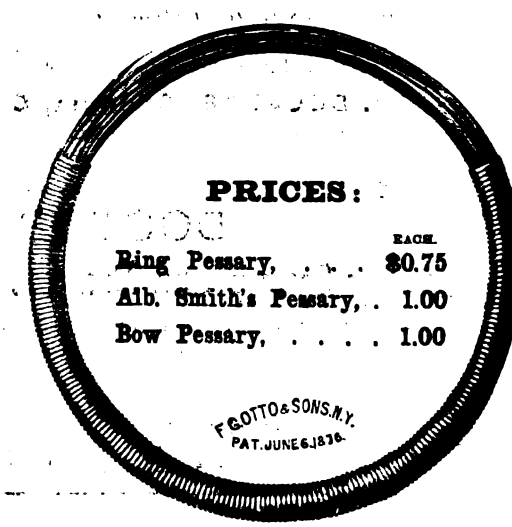
THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material; the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's, and all other shapes. *Manufactured only by*

F. G. OTTO & SONS, 64 Chatham Street, New York.



ROSCOE.

Lessons in Elementary Chemistry,

ORGANIC AND INORGANIC.

By HENRY E. ROSCOE, B.A., F.R.S.,

Professor of Chemistry in Owen's College, Manchester, England.

SECOND EDITION.

With a Chromo-Lithograph of the Solar Spectra. In one very neat 18mo volume, fully illustrated, bound in muslin, red edges.

PRICE, $1.50.

NOTICES OF THE PRESS.

"It has no rival in its field, and it can scarcely fail to take its place as *the* text-book at all schools where chemistry is studied."—*Chemical News.*

"We regard Dr. Roscoe's as being by far the best work from which a student can obtain a sound and accurate knowledge of the facts and principles of rudimentary chemistry."—*The Veterinarian.*

"We should be gratified to see this little treatise find its way into the hands of all medical students who begin their course in chemistry."—*St. Louis Medical and Surgical Journal.*

WILLIAM WOOD & CO.

PUBLISHERS,

27 Great Jones Street, New York,

Would most respectfully invite the attention of

PHYSICIANS, MEDICAL STUDENTS,

CHEMISTS AND DRUGGISTS,

TO THEIR LARGE AND COMPLETE STOCK OF

AMERICAN AND ENGLISH

MEDICAL BOOKS.

NEW BOOKS RECEIVED AS SOON AS PUBLISHED

BY MAIL OR EXPRESS.

MEDICAL BOOKS.

Messrs. Wm. Wood & Co. desire the consideration of the Medical Profession to their unequalled facilities for supplying Medical Books. Having been the heaviest dealers in their specialty for many years, and having the largest variety in stock to be found anywhere, they can usually fill any order sent them immediately.

Particular attention is paid to filling orders for *single books by mail or express.* When sent by mail, the regular retail price is charged, to cover cost of postage and extra care in wrapping. Single volumes, or larger numbers, when sent by express C. O. D., are charged at a discount of *Ten per Cent.*

ILLUSTRATED CATALOGUES of their own publications, and COMPLETE MEDICAL CATALOGUES of all works in the market, and Catalogue of New Sydenham Society Publication will be sent FREE ON APPLICATION to any address.

Publishers of the following Medical Journals:

THE MEDICAL RECORD,
NEW REMEDIES,
THE AMERICAN JOURNAL OF OBSTETRICS,
ARCHIVES OF OPHTHALMOLOGY AND OTOLOGY.

When you want any Medical Books, or any information concerning them, write to

WM. WOOD & CO., Publishers and Dealers in Medical Books,

27 GREAT JONES STREET, NEW YORK.

In corresponding with Advertisers please mention **The Medical Record.**

NAPHEYS'

MEDICAL THERAPEUTICS.

1 Vol., Large 8vo. 598 Pages.

SURGICAL THERAPEUTICS.

1 Vol., Large 8vo. 588 Pages.

Fifth Edition (1878), Enlarged and Revised to Date.

(For PRESS NOTICES, see "MEDICAL RECORD," April 13th.)

These two works have unequalled value for the practising physician. They give him a brief and clear synopsis of the practice of the most eminent living physicians and surgeons.

The **MEDICAL THERAPEUTICS** contains therapeutical directions from over 700 authors, and gives 1,346 formulæ drawn from the most eminent practitioners. But it is by no means a mere formulary. On the contrary, it aims to be a systematic analysis of all current and approved means of combating disease, including electricity, baths, massage, mineral waters, external remedies of all kinds, etc., etc.

Especial attention has been paid to noticing all the more important *New Remedies* and their applications, and the editor has introduced, as a special feature in this edition, the employment of the *botanical* remedies from the indigenous materia medica of the United States

The **SURGICAL THERAPEUTICS** is an entirely new and unique work, treating of the medical aspects of surgery.

The following are a few of the numerous subjects treated of in this volume:—

The Preventive Treatment of Inflammation. The Constitutional and Local Treatment of the Sthenic, Asthenic and Irritative Types of Inflammation. General and Local Anæsthetics. Anæsthesia of the Larynx. The Open Treatment of Wounds. Guerin's Raw Cotton Dressings. Hewson's Earth Dressings. Gamgee's Dry Dressings. Dolbeau's Alcohol Dressings. Lister's Antiseptic Dressings. Spence's Boracic Acid Dressings. Polli on the Sulphites as Antiseptic Dressings. Dr. Garretson's Specific Treatment of Erysipelas. Directions for Richardson's Styptic Colloid, Styptic Collodion, Cotton, Lint and Wool, Pancoast's Styptic, etc. Methods of Torsion and Pressure in Hemorrhage. Treatment of Shock, by Drs. Brunton, Hood, Gross, Fothergill, Fuller, Holmes, Hutchinson, etc. The Use of Physostigma, Aconite, Atropia, Strychnia, etc., in Tetanus. Weir Mitchell on Traumatic Paralysis and Neuralgia. The Latest Views of the German Surgeons, Esmarch, Stromeyer and Billroth on Gunshot Wounds. The Best Remedies in Hydrophobia. Halford's Ammonia Treatment of Snake-bites. Numerous Applications for Burns, Scalds, Frost-bites, Bedsores, Carbuncles and Boils. Syme's Treatment of Indolent Ulcers. Villate's Solution for Caries. Morton's Improved Treatment of Spina Bifida. Massage in Paralysis, Sprains, etc. Squire's Method with Nævus. Miner, Vallette, Colles and others, on Varicose Veins. Various authors on Caries of the Teeth, Pharyngitis and Tonsillitis. Ruppaner's London Paste for Enlarged Tonsils. Heaton's New Method for the Radical Cure of Hernia by Subcutaneous Injections. The Carbolic Acid Treatment of Hemorrhoids. Impotence, Masturbation and Spermatorrhœa occupy 30 pages, a monograph in itself.

The chapter on Lesions of the Organs of Special Sense includes the Nose, Eye, and Ear, as Cæna, Epistaxis, Rhinitis, Conjunctival Diseases, Iritis, Styes, Wounds of the Eye, Otorrhœa, Tinnitus, etc. Under new growths are given Mackenzie and others on Goitre, and the medical and local treatment of Fatty Tumors, Polypi, Warts, Corns, etc.; and twenty four pages are devoted to Cancer, giving Williams' Bromine Treatment, the Arsenical cure of Marsden and Esmarch, Maisonneuve's Caustic Arrows, Michel's Sulphuric Acid Paste, etc., and the famous "Cancer Salves" of Landolfi, Fell, Payne, Bright, etc. A chapter is given to the treatment of Scrofula as recommended by Gross Toland, Savory, J. L. Smith, Porcher, etc., including Scrofulous Ophthalmia, Ulcers, Glandular Enlargements, etc. The volume closes with chapters on the Therapeutics of Skin Diseases, Gonorrhœa and Syphilis, in the last of which Keyes' tonic treatment is described.

Especial pains have been taken to give carefully the uses and indications of recently introduced remedies, such as Chrysophanic Acid, Terebene, the Salicylates, Hamamelis, Dioscorein, Daturia, Eserin, Grindelia, Hydrobromic Acid, etc. The number of formulæ given is 987, drawn from the practice of the most eminent living surgeons. The Therapeutical directions are clear and minute, and the volume will be found unique of its kind, and invaluable in practice.

The two books are sold separately, at ***$4.00*** *in cloth, or* ***$5.00*** *in full leather, each, sent by mail, post-paid. Full Tables of Contents sent on application.* (Quote MEDICAL RECORD.)

D. G. BRINTON, 115 South Seventh St., Philadelphia.

VACCINE VIRUS.

EASTERN DISPENSARY—VACCINE DEPARTMENT.

PURE BOVINE (ANIMAL) VIRUS.

This Virus is the result of a continued reproduction from the famed Beaugency stock, propagated under our own immediate supervision at Pearl River, N. Y. It is furnished at the following reasonable

SCALE OF PRICES:

One Quill Slip,	**$ .25**	**Fluid in Capillary Tube,**	**$1.00**
Seven Slips,	**1.00**	**Three Tubes,**	**2.00**

N.B.—Each tube will vaccinate from five to ten persons.

Concrete Vesicle—i. e., Crust or Scab, $1.00 to $3.00, according to size.

HUMANIZED VACCINE VIRUS constantly on hand, as heretofore, at same rates as above.

We guarantee success with 95 per cent. of Quill Slips, and, if used with due care and within one week of reception, will duplicate all failures.

AUGUSTUS W. WEISMANN, *Chair. Vac. Com.*

Address, **S. S. BOGERT, M.D., Eastern Dispensary,**

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface)..... **$0.25.**
Capillary Tubes,..... **1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets.; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

Drs. ROBBINS & LEWIS, 94 Pineapple Street, Brooklyn. *Quote* MEDICAL RECORD.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, (Humanized, first removal from heifer.) each, . . *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

WARNER & CO.'S
SUGAR-COATED QUININE PILLS.

(With Twenty-Six Combinations.—See List.)

QUININE PILLS of our make are prepared from *Sulphate of Quinia* of American manufacture, noted for its purity and excellence. Each Pill contains the full complement of material as expressed on the label, without the necessity of adding any excess to compensate for impurities. They are perfectly soluble, and physicians can depend upon getting the full benefit of this valuable remedy in a pleasant form.

SUGAR-COATING, properly applied, does not impair the quality of such medicines as are commonly thus enclosed. *Dr. W. S. Edgar, Editor, says:*—"We procured a variety of W. R. WARNER & Co.'s preparations, and have prescribed them as opportunity offered, with *satisfactory evidence of their purity*, and reliability as to the quantity in each dose; also, we extract the following paragraph from a letter by a competent analytical chemist:"—

SUGAR-COATED QUININE PILLS.

"I take pleasure in testifying that W. R. WARNER & Co.'s QUININE PILLS are practically just what they claim to be, whether judged by analytical tests or by the therapeutic effect obtained from their use.

DETROIT, MICH. "A. B. LYONS, M.D., *Analytical Chemist.*"

WILLIAM R. WARNER & CO., Manufacturers of Sugar-Coated Pills,
1228 Market Street, Philadelphia.

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass, $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. "Successfully used for Dyspepsia, Diarrhœa and Female Complaints."—Prof. Sam'l Jackson, M.D., Univ. of Penn. "Invaluable for Neuralgia and Nervous Diseases."—Geo. T. Harrison, M.D., Woman's Hospital, N. Y. "Unequaled for diseases peculiar to females."—John P. Mettoser, M.D., LL.D., of Va. "Specific for Scrofulous and Cutaneous Affections."—J. M. Allen, M.D., of N. C. "Excellent Tonic Alterative and Diuretic—one of Nature's greatest remedies."—Medical Asso. of Va., Lynchburg. Address, **A. M. DAVIES, Prest. of the B. A. & I. S. Co., Lynchburg, Va.**

Sold by CASWELL & MASSEY, New York City.

SCOTT'S EMULSION
PURE COD LIVER OIL
WITH
HYPOPHOSPHITES OF LIME AND SODA
PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Original Lectures.

LECTURE ON ABSCESS IN THE NEIGHBORHOOD OF THE ANUS AND RECTUM.

By W. H. VAN BUREN, M.D.,

PROFESSOR OF SURGERY IN BELLEVUE HOSPITAL MEDICAL COLLEGE.

(Delivered at the College in the Spring Course, April, 1878.)

Abscess in the neighborhood of the rectum and anus is a very common affection, although it is often borne in silence, especially by women, through dislike of exposure and dread of the surgeon's knife. The practitioner who is familiar with the different phases of the disease has it in his power to prevent great inconvenience and suffering, and not unfrequently even to save life. Recognizing it by the description of characteristic symptoms, he can often say confidently to his patient, "Take a little ether and let me save you much trouble hereafter." There is no class of cases in which anæsthesia adds so largely to our power as in the surgery of the rectum; and here, in this country, where it was first discovered, the duty would seem to devolve upon us to demonstrate its practical utility in everyday surgery, for abroad, and especially on the Continent, the tendency is very strong to continue in the beaten track, and reserve it for the greater operations.

I shall assume that you know something of the general pathology of abscess. Here, as elsewhere, it takes its origin in the alteration or actual death of a portion of tissue, possibly very minute, which thus becomes a source of irritation sufficient to provoke an effort for its elimination or floating out from the organism by pus formation. This necrosis or change in quality of tissue—the ultimate cause of every abscess not due to the presence of an actual foreign body introduced into the tissues from without—may originate in *local traumatism*, or in *failure of local textural nutrition from general causes.* Thus, in answer to the question why abscesses should form in this region, we find amongst clearly substantiated antecedents the following: Perforation, immediate or ulcerative, by hard substances which have been swallowed and afterwards actually found in abscesses near the rectum, *e.g.*, pins, needles, fish-bones, sharp fragments of chicken and other bones—the pelvis of a snipe, an apple core, etc.; abrasions caused by impacted and hardened fæces, or by foreign bodies introduced through the anus, leading in some instances to perforating ulcer; violent stretching of the parts in forced efforts at defecation; contusions, as from kicks, or riding on horseback; mechanical or chemical irritation by contact of substances used for cleanliness, by scratching to relieve pruritus or eczema, or by the contact of strong perspiration after much walking, or of acrid secretions from the vagina; strangulated or irritated hæmorrhoids; the presence of stricture or cancer of the gut—of which the formation of abscess in the neighborhood is not an unfrequent complication; local chilling, as by sitting on a cold stone or a wet seat; finally, the tubercular diathesis, and also, in persons of good constitution, a temporarily vitiated condition of the blood and consequent depression of the vital powers.

We must not lose sight of the facts that chronic abscess of remote origin in necrosis of bone, and psoas abscess, sometimes gravitate to this region and point near the anus, and that the vicinity of an enlarged prostate, or a diseased bladder or seminal vesicles, may cause perineal abscess, and encroach upon the rectum. I have punctured an abscess seated between the prostatic urethra and rectum and projecting into the latter—to relieve retention of urine; and Gooch relates the case of an old gentleman long subject to gravel who, after a perineal abscess and much subsequent complaint of pain at the anus, was found, on examination (which had been unwisely deferred), with a urinary calculus of a slender, tapering shape, and over an inch long, projecting more than a third of its length into the rectum. Its removal was followed by cure. (*Chirurg. Works*, London, 1792, vol. iii., p. 216.)

I am disposed to emphasize the subject of etiology, because the more thoroughly we grasp the causes of disease the greater the chances of success by hygienic and preventive measures, and the more direct and rational our treatment.

Before describing any of the various forms in which we encounter them in practice, it is important to observe that *all abscesses near the lower end of the rectum have certain characteristic features in common*, viz.:

1. They can be rarely made to abort, going on almost inevitably to suppuration.

2. They do not heal readily, but as a rule tend to degenerate into chronic sinuses and fistulæ.

3. The pus which they discharge is offensive in odor, in consequence of the exosmosis of gases from the bowel.

From what I have said thus far you will already understand, I think, why it is a received rule of surgical practice that *these abscesses should always be opened, and opened early*, even without waiting for unequivocal evidences of fluctuation. It is another good rule, to be mentioned in this connection, that *all incisions for this purpose should radiate from the anus as a centre;* we thus avoid cutting across the general course of blood-vessels, and we escape, also, possible bad effects of subsequent contraction in healing.

Abscesses in this region vary in situation as well as in size, and they vary widely in gravity, as we shall see.

Often a little round lump will form just at the verge of the orifice of the anus, taking its origin from a hard stool, or an external pile, or the chafing of the napkin of a menstruating woman. It becomes hot, and exquisitely painful. This is, naturally, one of the most sensitive spots in the body; the sphincter is provoked to spasmodic contraction by the presence of the painful little tumor, which is therefore constantly pinched, and for four or five days, or until it bursts, life is a burden.

If abortion cannot be effected in twenty-four hours by a pig's bladder partially filled with ice and moulded accurately to the part, then the tumor should be freely incised. Freezing with ice or ether-spray might replace general anæsthesia. Afterward a piece of fine sponge, cut to fit the part and moistened with laudanum or comp. tinct. benzoin, may be kept in contact with it. These little anal abscesses, which, like those of the eyelids (hordeoli), often originate in glandular follicles, cause an amount of pain out of all proportion to their size. They occur more frequently before middle life, and in some individuals show a tendency to habitual recurrence. The regular use of an astringent or alcoholic lotion to harden the skin is often of service in such cases. One form of this marginal abscess undoubtedly takes its source in a little varicose venous pouch—one of the varieties of origin of the external hæmorrhoid; this, when left to itself, is likely to leave behind it a minute "blind external

fistula," often associated with a little flap of shrivelled integument.

A *painless* variety of marginal abscess sometimes forms insidiously, generally in a delicate, perhaps phthisical subject; it may discharge itself and leave a little fistula without its existence having been suspected. This is more of the nature of what is known as the "dermoid" abscess, and it requires decided local stimulants to make it heal after incision.

Where the focus of pus formation is situated farther from the verge of the anus and beyond the grip of the sphincter, the pain, even of the acutest grade of abscess, although from its greater size very considerable, is not so constant and intolerable as in the first variety. There is more or less extensive redness of the skin, followed by central softening, and accompanied by febrile reaction. Entire rest, narcotic and sedative poultices, with early and free opening, are the remedies. Such a case, if not promptly met, might linger a fortnight or longer. One of its prominent difficulties is to provide for defecation without great temporary increase of pain. It is better that this should be done daily, or every other day, than to run the risk of fæcal accumulation and its consequences, which might interfere with subsequent prompt repair. The best means to use for this purpose are a moderate dose of some mild, reliable laxative, such as castor oil, sulphur and cream of tartar, or fluid extract buckthorn, assisted at the right moment by an enema of warm water and sweet oil.

The introduction of the nozzle of the injecting tube is not painful under these circumstances, if rightly managed, and it is usually wise to overrule the objections of a patient who has no experience of this remedy. The obstruction to the local circulation from a loaded rectum constitutes a positive aggravation of the malady.

This is the more common form of acute abscess near the anus. When left to itself the complete relief from pain which follows spontaneous discharge leads the patient to dismiss the trouble from his mind and consider himself cured. It is only some weeks later that the fact forces itself upon his attention, in consequence of finding his clothing more or less constantly soiled by a watery and perhaps offensive discharge, that a fistula has formed.

It happens, occasionally, that a collection of pus forms outside of the rectum, in most cases just on a level with the upper limit of the sphincter, and, failing to reach the surface externally, and in most cases causing no very urgent pain, finally discharges itself into the bowel, so that the patient, after voiding some matter at stool, finds himself relieved. It is in this manner that what is called the "blind internal fistula" forms —a variety of fistula which is not very common. The relief, however, in a case like this, is not usually permanent; a hard lump remains somewhere on the buttock, near the anus, and continues somewhat tender on external pressure; sooner or later it becomes the seat of another abscess, which may break externally, and thus the complete process of repair failing, the "blind internal fistula" is converted into a "complete fistula."

In both this and the last variety of abscess the exciting cause is undoubtedly, in most instances, a perforating ulcer at the bottom of one of the lacunæ of the rectum, which are situated just above the external sphincter, the ulceration having been provoked by the lodgment in the little pocket of some source of irritation derived from the passing fæces. Hence an explanation of the fact that when a complete fistula follows one of these abscesses its communication with the bowel is found most frequently just above the upper limit of the external sphincter. Not rarely the starting-point of the abscess is in the substance of this muscle, so that the resulting fistula actually traverses the muscular mass. When the abscess extends entirely outside of the sphincter muscle, it then occupies the ischio-rectal fossa, and, in the loose connective tissue and fat of this region provided to accommodate the varying bulk of the rectal pouch, finds room for rapid development.

It is a much more grave form of rectal abscess, that which takes its origin, at first, deep in the ischio-rectal fossa. It is caused in some cases, doubtless, by ulcerative perforation of the rectal pouch; in others as a direct result of constitutional dyscrasia. The progress of these cases is often slow, insidious, and depressing, because the pus tends to travel inwards—in the direction of least resistance rather than towards the surface. The dense integument and subcutaneous cushion of the buttock become thickened and brawny, often over a considerable extent of surface. There is not, necessarily, any very urgent pain or throbbing; but fever is present, and frequently there are evidences of septicæmic depression. When the surgeon is not familiar with these cases, and waits for evidences of fluctuation before interfering, extensive destruction of pelvic connective tissue may occur, involving danger to life. A finger in the rectum will recognize increased heat and an œdematous, doughy feel. The indications are those of phlegmonous erysipelas; the surgeon should make an early and free opening with the knife through the integument, and follow it with his finger, so as to secure a direct and sufficient outlet —not only for pus, but for sloughy débris. This affords the only assurance of safety. When it is neglected there is liable to be extensive surface ulceration and sloughing, with an amount of destruction of pelvic connective tissue around the lower end of the gut, which is often irreparable; and where the patient does recover he is liable to permanent disability.

I was consulted recently by a healthy-looking Western gentleman, in middle life, who was about to marry a second time, for occasional inability to prevent escape of flatus from the anus, and when his bowels were loose he was also liable to incontinence of fæces. He had been operated upon twenty years before for fistula, but through his own neglect the disease was not cured. Other abscesses followed, one of which was very severe and extensive, and it left, after long convalescence, several new fistulous tracts. These were subsequently laid open at different operations, and all healed soundly. On examination I found the anal orifice retracted much more deeply between the nates than usual; indeed, vigorous pulling asunder of the buttocks was required to bring it into view. It was formed posteriorly by a dense cicatrix, and a slight protrusion of mucous membrane presented. There was no grip to the sphincter, which had evidently been seriously damaged. There had been also, pretty certainly, extensive loss of substance of the pelvic connective tissue around the lower end of the rectum, and powerful contraction of the granulation tissue during repair. The excessive retraction of the anus was also in part due to the constant use of the *levatores* in efforts to aid the weakened sphincter in retaining the contents of the bowel. The parts presented the appearance which might have followed entire removal of two inches of the lower end of the rectum, including the anus. Recognizing no prospect of benefit from operative interference, I advised palliative measures, amongst others the wearing of a small plug of prepared oakum moulded to the part.

The result of another case which I saw some years ago was even less favorable.

A gentleman of 47, of good constitution, but sedentary, luxurious, and self-indulgent in his habits, developed a deep ischio-rectal abscess without any obvious cause. The symptoms were serious and the surface induration excessive. His usual attendant, who watched the patient assiduously, discovered some soft, imperfectly fluctuating points towards the end of the third week, and made small punctures. Ulceration and sloughing followed, and when I saw the case later there was a gap several inches deep extending pretty much from the coccyx to the base of the scrotum, and this was being dressed in daily with lint. The granulations were feeble, and the patient's vitality very much depressed. Syringing with aromatic wine and painting with balsam Peru and comp. tinct. of benzoin were substituted for the lint dressing, and a general supporting treatment adopted. Under this course the patient gained, but very slowly, and declining the advice to take a sea voyage as offering the best chance to stimulate his flagging powers of repair, went to the country at the end of six weeks to avoid the summer heats, where some months later I saw a notice of his death—from exhaustion. In this case I formed the opinion, in consequence of the utter lack of vital force of the patient, that a depraved condition of the blood, and, in fact, of the whole organism, from a long-continued, faulty mode of living, was the cause of his attack, and I feel confident that this form of abscess comes often in a similar way.

There is, plainly, a wide interval between the little, round, painful abscess of the margin of the anus and the grave forms of disease just described, and in practice we encounter many varieties of abscess intermediate with these which I have brought forward as typical examples; but it is worthy of being always borne in mind that the same rule of treatment is imperative in all abscesses near the anus or rectum, viz., to open early and freely, with the double object of shortening the period of pain and tissue destruction, and of securing a cure, if possible, without fistula.

Troublesome bleeding from opening these abscesses rarely occurs. Pressure applied in the usual method, by compresses and a T bandage, or strips of adhesive plaster, is always available, but I prefer the sub-sulphate of iron—used either in solution, or as a dry powder. I have found this substance entirely efficient as a hæmostatic, and it makes a good dressing—possessing no irritating or escharotic properties, but, on the contrary, being an excellent disinfectant, and a salutary local stimulant. It forms a scab under which healing goes on without pus formation. I have filled the cavity of an abscess with the dry powder, blowing it in through a tube, after the manner recommended by Marcus Aurelius Severinus for his famous "catagmatic powder," with excellent effect. There is no reason, therefore, why the abscess should not be opened so freely as to render any subsequent retention of pus impossible, and this is the condition on which prompt healing and escape from the formation of a fistula depend. I have little doubt, after the results I have seen from the antiseptic method, that if it were faithfully used in opening and dressing these abscesses, and accurate drainage secured by means of caoutchouc tubes or horse-hair, healing without fistula would be the rule, instead of the rare exception, as at present. The striking success of Volkmann, as set forth in his recently published operations upon the rectum, certainly justifies this hope. But even with the aid of antisepsis in insuring prompt repair, early and free opening cannot be dispensed with.

There is a variety of abscess properly mentioned here which constitutes an exception to the rule I have just laid down, and our knowledge of it is both recent and valuable. The cavity beside the rectum, familiarly known as the *ischio-rectal fossa*, was first accurately described, and this name given to it, by Velpeau, in 1829. In 1856 Richet first pointed out and described formally a region lying beside the rectum, but *above* the ischio-rectal fossa, and separated from it by the levator ani muscle and the fasciæ which line its surfaces. This musculo-membranous diaphragm forms at the same time the roof of the old fossa and the floor of the newly-described space which, in fact, lies between it and the parietal aspect of the peritoneum as the latter is reflected from the walls of the pelvis over the rectum and bladder. In the loose connective tissue which occupies this "superior *pelvi-rectal space*," as Richet has named it, abscess occasionally forms.*

The symptoms which accompany the formation of an abscess in this region are obscure, and its progress slow, in consequence of the difficulty with which the pus finds an outlet. The musculo-membranous layer of the levator is not easy to penetrate. Ultimately the pus discharges, either by ulcerating into the rectum—high up, of course—or by working backwards through a partial opening which exists normally in the median line near the sacrum. It now escapes from the pelvis through the upper sacro-sciatic opening, or gravitates downwards beside the rectum, and points externally near the anus, constituting a variety of fistula which requires a special treatment for its cure, and this we shall consider hereafter. The route by which the pus of an abscess of the upper pelvi-rectal space escapes is the same which is followed by an abscess taking its origin near the vertebral bodies, when it makes an opening near the anus, simulating fistula in ano.

These, then, are examples of varieties belonging to our category of abscesses near the anus and rectum, which we cannot open early, simply because they cannot be reached, even if accurately diagnosticated. I could not have covered the subject of the present lecture without mentioning them, nor could I have completed the etiology of fistula—as far as fistula takes its origin in abscess—which I also had in view.

Some years ago I watched with much interest the case of an eminent lawyer, who ultimately died exhausted from the effects of what I afterwards recognized as an abscess of the upper pelvi-rectal space. He was of delicate constitution, but not manifestly tubercular. The disease appeared at 55, after failure of the general health. Pus presented at the sacro-sciatic foramen, where I gave it vent, and the sinus, which communicated with the interior of the pelvis, never healed. Another abscess formed later on the buttock. The functions of the pelvic viscera were not seriously deranged. There was no evidence of diseased bone.

What are the chances of cure, without fistula, of abscesses near the rectum or anus? Allingham's table (*Disease of Rectum*, London, 1878, p. 19) of 4,000 consecutive cases of rectal disease observed at St. Mark's Hospital (out-patients) includes 196 abscesses, with the remark added that "of these 151 became fistulæ, and the rest were probably cured." This would give nearly twenty-three per cent., or about one in four, which I should consider somewhat too favorable a prognosis. It remains for us to improve the chances of cure by our methods of treatment, and the points I have sought to make look to this end. The

* Anatomie Méd. Chirurg., Paris, 1873, 4th ed., p. 93

following case, which illustrates still another variety of abscess, is of interest in this connection:

A lady of 28, of good constitution and well nourished, under treatment for a syphilitic taint communicated by her husband, rather suddenly failed in health, and soon after became conscious of pain and swelling near the anus. When I saw her there was a flat, fluctuating tumor, as large as a pullet's egg, extending from the left buttock to the anus. The pus was evidently just beneath the skin, but there was no redness at any point. It was opened freely, giving vent to a quantity of dark-colored and very fetid matter. Under quinine and wine this abscess healed entirely within six weeks, without any local treatment beyond a poultice, leaving no fistula. I verified the cure by subsequent examination, for I had told her, before opening the abscess, as I always do, that it would probably not heal without another operation, and she was, therefore, suspicious. Three years afterwards this patient had another abscess of the same character, but on the opposite side of the anus, which was treated in the same way, and it also got well within the month. I have examined this lady since, and found the cure perfect.

We shall next take up the subject of fistula.

Original Communications.

VESICULAR ERUPTION INDUCED BY THE INGESTION OF CANNABIS INDICA.

By JAMES NEVINS HYDE, M.D.,

CHICAGO, ILL.

No attempt has been made to furnish all the details in the early history of the case subjoined, since they throw no special light upon the lesions to which it is designed to direct attention. Full notes of this history are, however, in my possession, and from these I merely select for reproduction the salient points, which will enable the reader to verify the statement made respecting the fact of syphilis.

On the 12th of January, 1874, I was consulted by Mr. F., an intelligent gentleman, aged twenty-four years, of nervo-bilious temperament, well-developed in frame, and free from venereal antecedents other than those here noted. He stated that a gland had enlarged in his left groin in August, 1873, and that, in three weeks thereafter, a sore appeared on the left side of the glans penis, which speedily healed under the treatment of a physician, who decided that it was not of a syphilitic character. Cataplasms were applied to the inguinal swelling, and in ten weeks an incision was made without giving exit to pus. Later, poultices having been continuously applied, a serous discharge escaped from the opening. In November, adenopathy of the right side ensued, notwithstanding which he proceeded, by the advice of his physician, to fulfil a marriage engagement. On his way to New York, where the ceremony was performed, a second sore appeared on the right side of the frenum. This had been twice cauterized with carbo-sulphuric paste, but had rapidly enlarged. He stated that sexual intercourse with his bride had not been effected.

I found upon the corona glandis and adjacent sulcus an ulcer as large as a quarter of a dollar, with an irritable, reddish-gray, granulating and hemorrhagic floor, surmounting an engorged and indurated tissue-mass as large as a chestnut. There was cervical, epitrochlear, and double inguinal adenopathy, serum exuding from an incision in the left groin, sallow complexion, nausea, cephalalgia, and peri-articular pain. He was cautioned as to the danger of infecting his wife in intercourse, and placed upon appropriate treatment.

On the 25th of the same month, I was summoned to his residence, where I found him in a condition of great nervous prostration and anxiety, induced by the fear that he had infected his wife. He then stated that, though he had truly informed me that intercourse had not been effected, still there had been, on several occasions before my first examination, contact of the sexual organs without penetration. On the internal face of the left labium majus of the wife I found a single ham-colored, split-pea sized macule, which in two days was transformed into a clean-cut ulcer of corresponding size. Multiple adenopathy of the groins followed.

The subsequent syphilitic history of these two patients may be briefly summarized. The husband was soon extensively covered with a symmetrical macular syphilide, out of which papular lesions speedily developed, of similar distribution and persistent type, affecting the face, chest, abdomen, and extremities. The glazed, copper-colored papules of the forehead, constituting the well-known *corona veneris*, proved to be in this case especially annoying, resisting for a long time general and topical treatment. During the years which succeeded, no further eruption was displayed, though numerous gummy tumors of the skin have formed and undergone resorption. Treatment by mercury (inunction, fumigation, ingestion), potassic iodide, and tonics has been faithfully, persistently, and vigorously conducted.

Three months after infection, the wife had severe iritis of one eye, mucous patches of the vulva, and unsymmetrical papulo-squamous syphilide of mild type. During the ensuing year, she aborted with a still-born, macerated fœtus, which had probably been dead for ten days. In 1877 she miscarried with a six-months' infant, which survived but two days. After the completion of each gestation, I examined the products of conception; and in the last instance, made a careful post-mortem section of every portion of the body and of each viscus. No lesion of the soft parts was discovered; the bones are reserved for microscopical examination with a view to comparing results with those observed and minutely described by Parrot. Sections of these present to the naked eye no abnormal appearance.

Since the last pregnancy, the wife has exhibited a gummy tumor as large as a pigeon's egg over the left mamma; and has suffered from suppurative otitis externa. Her treatment has, in general, been that pursued in the case of her husband, exception of course being made of that directed to the relief of special symptoms, iritis, etc. Both husband and wife are now in fair health. This is, in brief outline, the syphilitic history of the family.

On the 16th of December last, Mr. F. came to me, greatly alarmed, declaring that he again had a syphilitic eruption. I discovered, on examination, that the cutaneous surface of the lower portion of the abdomen, back, hips, and thighs, was covered with lesions in groups, which he could not avoid scratching, even when subjected to inspection. These lesions were hot, irritable, pea-sized, flattened, rose-colored *boutons*, or urticarial papules, with scratch lines evident between them. With a half-inch lens I could

discover no central punctum, though here and there were minute blood-scales on the summit, the result of the wounds inflicted by the finger-nails. I suspected that the disorder had originated in the bites of the *cimex lectularius;* and, when questioned, the patient admitted that he had recently slept at a country inn, where he had been greatly disturbed during the night, as well as his fellow-traveller who shared his bed. He then remembered that each had discovered the eruption in the morning. These accidents subsided in a few days, after an alkaline bath and the application of a lead lotion. The incident is mentioned here in order to illustrate the fact that I was dealing with a patient whose skin was peculiarly susceptible to irritation.

On the 8th day of January last, Mr. F. again called upon me in alarm, insisting that, at this time certainly, he exhibited the evidences upon his skin of a fresh explosion of syphilis.

Upon examination, I discovered that the surface of the scalp, face, ears, neck, chest, dorsum, abdomen, and extremities, including the palms and soles, was covered with an eruption of strictly disseminated vesicles, nowhere arranged in groups, in various stages of development.

Dr. L. A. Duhring, of Philadelphia, recently described, in a clinical lecture delivered at the Hospital of the University of Philadelphia,* the peculiarities of a bullous eruption, due to the iodide of potassium, occurring in a patient affected with eczema. The description given of the lesions is admirably exact, and it is interesting in this connection to note the points of resemblance and dissimilarity between the induced phenomena in the two cases.

In the following particulars the eruption in the case of the two patients displayed similar features: the vesicles were generally elevated above the surface of the skin from one-half to two lines, were roundish in shape, tensely distended by their contents, and contained a clear serous fluid, no blood nor pus. They were, when mature, well-formed, persistent, showed no disposition to rupture, even when firmly pressed upon, and were yellowish-gray in color, having a glistening look due to the external surface of the capsule of each. They were implanted upon a slightly reddened base without peripheral areola, and existed in every stage of development to complete maturity. When ruptured (some had been purposely ruptured by the patient himself), a moderately large drop of clear serum exuded. The integument upon which they were seen was neither œdematous nor infiltrated.

But in the following particulars the eruption in the case of the two patients differed: in that here reported, the lesions varied in size from pin-point to small split-pea, and were in no case larger. They did not coalesce so as to form bullæ; indeed, were not closely packed, as interspaces of a diameter of two inches could be occasionally observed. There were hence no coalition septa, nor were puncta to be seen imbedded in any, like boiled sago grains. They were slightly acuminate rather than flattened, and in no instance umbilicated. When first examined, none were in phase of retrogression, and were thus neither shrivelled nor macerated.

The incipient lesions were not suggestive of miliaria —the condition in which minute vesicles appear upon the surface, like scattered seed-pearls. On the contrary, the papular origin of each was quite distinct, many papulo-vesicular forms showing upon the lower extremities. The eruption was symmetrical, but yet more abundantly developed upon the upper than upon the lower segment of the body.

When the eruption subsided, as it did to a marked degree in a few days without treatment, the vesicles shrivelled without bursting, and left neither ulcer nor scab, merely a light desquamative crust of yellowish-red hue, which left, after falling, a transitory hyperæmia of the surface.

The patient complained of a moderate degree of itching, which in no sense compared with that from which he suffered when affected with the pruriginous *boutons* described above. He readily controlled the effort to scratch, and even complained, when his scalp was handled, of a certain degree of tenderness and soreness there. Here, as also upon the legs, palms, and soles, were many abortive lesions, but several fully-developed vesicles could be seen upon the scalp.

The facial vesicles presented a peculiarly livid appearance during the time of this examination. It was due to the intense mental agitation of the patient, the surface of the skin of the face being engorged with blood. He had not forgotten his old syphilitic papules in the same locality, which betrayed his secret to many unskilled observers.

The disease was readily differentiated from *eczema* by the fact of the permanent character of the vesicles, and the absence of any evidence of dermatitis. The failure to recognize the "boiled-sago-grain" appearance, and the absence of sweating, excluded *dysidrosis* —the disease which Drs. Fox, Liveing, Tay, and Tweedy have of late been vigorously discussing in the *British Medical Journal.** The absence of concentric arrangement, as pointed out by Dr. Duhring in his case, forbade confusion with *herpes iris.* The absence of fever and failure of development into pustules excluded the supposition that the disease of the skin had been induced by either *variola* or *varioloid*, though unquestionably there are forms of the last-named disease, such as the so-called "horn-pox," which it would be difficult to differentiate, especially in cases where there had been no precedent febrile state. The straw-colored "stuck-on" scabs of *impetigo contagiosa* were not observed. Uniformity of lesion, absence of itching, with nocturnal aggravation, and the extent of the disease, were not characteristic of *scabies*, while the distribution of the lesions precluded the possibility that they were induced by *zoster.*

An important question remained: Were the lesions produced by syphilis? I had no hesitation in deciding that the eruption was in no way associated with the syphilitic diathesis undoubtedly present in this case, although I am aware of the fact that my position on this point will probably be disputed by many. My reasons for this decision may be briefly given as follows:

1. Vesicular lesions are rare in syphilis. Lancereaux,† in his voluminous treatise, devotes but little more than one page to their consideration. Bassereau observed, in all, but twelve cases. I can recall but two cases of distinctly and purely vesicular syphilis, observed during more than fourteen years' experience of the disease, and in neither of these were the lesions similar to those described above.

2. The character and behavior of the vesicles in this patient were not those peculiar to the specific forms. In the three varieties described in most of the text-books ("varicellar," "eczematous," and "herpetic"—inexact terms at the best) there is usually a history of

* Medical and Surgical Reporter, Aug. 4, 1877, p. 89.

* *Vide* Nos. for December 8, 15, and 29, 1877, and of January 5 and 12, 1878.

† Traité de la Syphilis, Paris, 1874.

either faint umbilication, transformation into pustular lesions, areolæ of congestion or inflammation, segregation into groups, localization in or about the hair follicles, indurated and copper-colored base, sequence of scabs, scales, ulcers, or cicatrices, or obscurity of cause. Without particularizing, it will be seen that these were not phenomena noted in the case under consideration.

3. The patient in this instance had survived that period of syphilis in which we look for superficial, symmetrical, and short lived cutaneous manifestations. It is true that Wilson has described a corymbiform vesicular syphilide, occurring as a late symptom in tertiary or neoplastic stages of the disease. But in his patients the lesions were small red papules, vesicular at the summit merely, occurring in patches made up of more or less concentric segments of circles.

For these reasons it seemed to me that the eruption in this instance could have been produced only by some of the irritant ingesta. The patient had not taken the potassium iodide for several months before the occurrence of the disorder. Just prior, however, to the discovery of the lesions of the skin, a friend had given him, for the purpose of relieving pain in the chest, two of the gelatine-coated granules manufactured by Messrs. McKesson & Robbins, of New York, containing each a half grain of the extract of cannabis indica. He had taken these in the evening, and soon after, commencing to feel drowsy, he had retired to bed. He passed the night in a heavy, dreamless sleep, having been much exhausted during the previous day by necessary attention to his business. In the morning the eruption was perceptible over the surface of his body.

In a few days, as has been already stated, without the administration of other remedies than a gentle laxative, the eruption entirely disappeared. The patient remained at rest in his house for three days, merely dusting some finely-powdered starch over those portions of the skin exposed to the air or undue friction of the clothing.

DISLOCATION OF RIGHT THIGH UPON THE DORSUM ILII OF SIX MONTHS' STANDING.

DISLOCATION OF LEFT THIGH, WITH FRACTURE OF NECK AND NECROSIS OF HEAD; FALSE ANCHYLOSIS OF LEFT KNEE IN FLEXED POSITION; REDUCTION OF DISLOCATIONS; EXCISION OF HEAD OF LEFT THIGH, AND ESTABLISHMENT OF SERVICEABLE FALSE JOINT; EXTENSION OF ANCHYLOSED KNEE AND RESTORATION OF MOTION; CURE.

By PROF. GEORGE E. POST, M.D.,

SYRIAN PROTESTANT COLLEGE, BEIRÛT, SYRIA.

FUTÍN, aged 13 years, presented herself Jan. 20, 1877, at the polyclinique of St. John's Hospital, in Beirût, with a complication of injuries, the result of a vis a tergo, applied six months previous to admission, producing a fall forward, and a twisting of the trunk to the right, and the lower extremities to the left. The appearance of the child at entrance was that of a shapeless bundle of rags, from beneath which a pain-stricken face was turned pleadingly upward by a twist in the back and neck. The body lay prone, both hips were strongly flexed, the right knee was opposite the left shoulder, and the left knee several inches to the left of the other. She could neither sit nor stand, nor lie on her back, nor extend her legs. As soon as she had become accustomed to the regimen of the hospital, she was put under chloroform and laid on her back. An examination of the left hip revealed a foul sinus, at the bottom of which was a round mass, which proved to be the head of the thigh-bone. This was removed by an incision, the cicatrix of which is clearly visible in the second of the two photographs. The thigh was then brought forcibly down to a position parallel with the axis of the body. In effecting this manœuvre, strong bands of adhesion with the pelvis were broken down, and the contracted integument and subcutaneous tissues considerably lacerated. The anchylosed knee was then straightened, a process which involved the laceration of the false ligaments, and to a considerable extent of the thin and subjacent cellular tissue also. The left lower extremity was then committed to an assistant, while the requisite manipulations were undertaken to reduce the dislocation of the right hip. This was effected without pulleys, adding another to the many proofs that bone-setting is a matter of address and attention to anatomical relations rather than of force.

The shock to the system of these extensive lacerations was very powerful, and occasioned no little anxiety. The patient having rallied somewhat, the right lower limb and the pelvis and lower part of the abdomen were enveloped in wire gauze well padded. The wound in the hip and the lacerations in the groin and popliteal space of the left side, coupled with the necessity of using extension to secure a favorable position to the new joint, forbade the use of the wire splint on this side. Its place was supplied by Buck's extending apparatus. The weight used was about five pounds.

The reaction after the operation was intense. The injured knee became violently inflamed and swollen, making it difficult to retain the extending bands in position. The joint was relieved from pressure by padding beneath the adhesive strips above and below the knee. After several days of violent fever the whole body became œdematous, the urine was loaded with albumen, the complexion assumed a waxy aspect, and for weeks it seemed that the patient must succumb. These grave symptoms yielded, however, to the use of large doses of quinine with anodynes, and, after six anxious weeks, the œdema began to lessen, the swelling of the knee declined, the general health began to improve, the albumen disappeared from the urine. Extension was maintained for two months longer, after which all retentive apparatus was removed. The right hip had long since fully regained its functions. The left knee was stiff, but not immovable in its new position. The patient could lie on the back, on either side, sit up in bed, and flex both hips. After the sixth month she began to rest her weight on the sound limb, and sit or stand by the side of her bed. Little by little she learned to walk, and at the date of the taking of the photographs from which the accompanying cuts were drawn, she was able to walk a mile with the aid of a crutch. She now stands, sits, lies in any position, and, by a twist in the pelvis and back, places the soles of both feet on a level when she walks. The real shortening is just 4½ inches, measured in the usual way from the anterior superior spinous process of the ileum to the inner ankle. The length of the sound limb is twenty-seven and a half inches.

Fig. 1 represents the relative length of the two limbs, when the twist of the pelvis is designedly overcome by placing a stone under her left foot.

FIG. 1.

Fig. 2 illustrates the uses of both hip and knee, and shows the scar of the wound through which the head of the thigh bone was extracted. Several pieces

FIG. 2.

of necrosed bone from the upper part of the shaft of the thigh have been discharged from the same opening. Both hip and knee can be considerably more flexed than is represented in the cut. The motion of abduction in the injured extremity is slight, but that of the opposite thigh is unimpaired. It will be seen that the nutrition of all three divisions of the injured limb compares favorably with that of the sound one. The general health of the patient is perfect.

FRACTURE OF THE PATELLA.

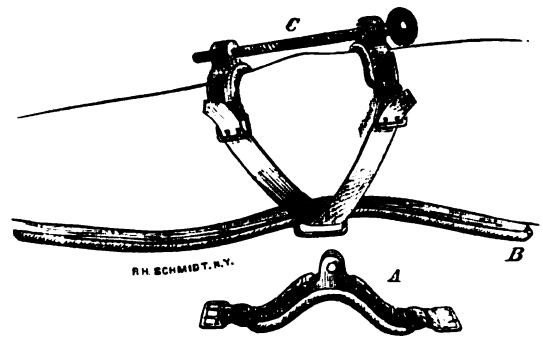
INJECTION OF ANIMAL MARROW BETWEEN THE FRAGMENTS.

By JOHN A. WYETH, M.D.,

NEW YORK.

G. S., MALE, Irish, æt. 35. In December, 1876, while in the act of falling backward, the leg being flexed and the *quadriceps extensor* on the strain, struck the right patella against the edge of an iron safe-door, sustaining complete transverse fracture of this bone about its centre. Nine weeks later I was called to treat him. Found the fragments separated about an inch, with no union, and inability to move the leg with the *quadriceps*. I approximated the pieces by means of an adhesive strip fastened above the upper fragment, and applied strong extension in the axis of the limb. A fixed dressing of plaster-of-Paris was immediately put on. Twenty-four hours after this the patient was allowed to walk about at will. Three weeks later the plaster bandages were split in front, the dressing removed, careful passive motion made at the knee, and the "movable-immovable" dressing readjusted. Six weeks after the first gypsum dressing was applied, the splint was discontinued. A good fibrous union, with a half-inch separation, was secured, and patient went to his business.

Five days later he fell on the ice-covered sidewalk, and struck with such violence on the injured knee that the skin was severely lacerated, and the upper fragment pulled three inches above the lower. So firm was the union already obtained that before this second separation occurred, a portion of the *rectus femoris* tore loose at its attachment to the upper fragment, and was found contracted into a hard lump, about as large as a walnut, half-way up the thigh. Finding none of the ordinarily described means sufficient to readjust the fragments, I had Mr. Philip Schmidt, of this city, construct the instrument figured



here, which consists of two well-padded pieces of iron (*a*), one inch and a half wide, made to fit the convexity of the thigh and leg above and below the patella, and *to project at the sides, so that the straps which pass through a staple on the back of the splint* (*b*) *will not press upon the sides of the leg, and thus interfere with the circulation to the broken bone.* The two curved pieces are connected by means of a screw (*c*) about eight inches long, which, when the instrument is adjusted, as seen in the cut, can be tightened at will. When the splint is to be worn for any length of time it will be best to apply two pieces of gutta-percha, moistened and fitted to the limb, above and below the patella, and adjust the curved pieces upon these. A greater surface is thus obtained upon which the pressure is exerted. If the gutta-percha be turned

up at the end nearest the patella the instrument cannot possibly slip over, while any tendency to tilt upward can be corrected by allowing the pieces to extend six or seven inches up (or down) the limb where they should be fastened by a roller. (The principle is the same as that of Lonsdale's and other instruments, but this one is simpler in its mechanism, and cheaper. When the patient is to remain in bed under treatment the posterior splint should extend to the foot, and have a foot-piece attached.)

Having brought the fragments into apposition, this instrument was removed after twenty-four hours and the plaster dressing again applied. A fenestrum was cut out over the patella, and following the experiments of Ollier and Goujon (Flint's *Physiology*, p. 547) upon animals, who found "that marrow transplanted into the muscular tissue will frequently (not always) generate bone," I injected, by means of a large hypodermic syringe made for this purpose, ʒij. of marrow from the femora of a young and healthy sheep, just killed, between the slightly separated fragments. No unusual inflammation ensued, nor did I succeed in getting other than the customary fibrous union. I do not know that bone-cells, transplanted from a lower animal into man, will generate bone-tissue, under the most favorable circumstances. I believe that the circumstances in this case were exceedingly unfavorable, and the failure to get bony union in this instance shall not prevent a repetition of the experiment when the proper occasion offers. I deem it very probable that the marrow which, when transplanted into the muscular tissue of the same animal will generate new bone, will, when injected between the fragments of an ununited fracture in man, where the conditions are favorable for bone-formation, stimulate the formation of callus.

April 10, 1878.

Progress of Medical Science.

Battey's Operation.—In August, 1872, Dr. Robert Battey, of Georgia, for the first time, performed the operation of removing the ovaries of a woman for the purpose of bringing about the menopause. Since then it has been performed by Sims, Hégar, Trenholme, Gilmore, Thomas, Peaslee, Sabine. Dr. Sims reviewed these cases in the *Lancet*, and although the success has not been very great, he is confident that the failures were due to errors that may be avoided, and that at no very distant day this operation will rank with that of ovariotomy. The inferences he draws from his analysis are these:

1. Remove both ovaries entire in every case.

2. As a rule operate by the abdominal section, because if the ovaries are bound down by adhesions, it is possible to remove them entire, whereas by the vaginal incision it is impossible.

3. If we are sure that there has been no pelvic inflammation, no cellulitis, no hæmatocele, no adhesion of the ovaries to neighboring parts, then the operation may be made by the vagina, but not otherwise.

The operation may be resorted to under the following conditions:

1. In cases of amenorrhœa where there is no uterus, or only the rudiments of one, or where there is an incurable atresia uteri, and the menstrual molimen produces such violent disturbance of the whole system as to destroy health and endanger life, the removal of the ovaries is the only means of permanent relief.

2. In cases of prolonged physical and mental suffering, attended by great nervous and vascular excitement produced by perturbed menstrual molimen, whether menstruation be absent, scanty, or otherwise, this operation is justifiable, after all the usual remedies have failed to relieve.

3. In cases of incipient insanity and of epilepsy depending on ovarian and uterine disease, this operation is justifiable after all other remedies have failed to cure.

4. In cases of fibroid tumors of the uterus, attended with incurable hemorrhages that endanger life, when the tumors cannot be safely enucleated and removed, this operation may be resorted to with the hope of arresting the bleeding and the prospect of diminishing the tumors.

5. In cases of chronic pelvic cellulitis and of recurrent hæmatocele, when the attacks are traceable to the disturbing influences of the menstrual molimen, we may have recourse to this operation as a *dernier resort*.

This operation was first introduced under the name "normal ovariotomy," so apparent a misnomer that the Record spoke of it as "Battey's operation," a title which has now come into general use and which Dr. Sims has retained in his pamphlet.

Tracheotomy in Diphtheritic Croup.—The true value of tracheotomy in diphtheritic croup is a question for the decision of which more accurate and reliable data is required than we as yet possess. As a contribution to this literature, comes a report, by Dr. Bogue, of Chicago, of fifteen cases in which he operated, six of them successfully. This is not a large percentage of recoveries, but attention is called to the fact that, if left alone, these six successful cases would, in all probability, have shared the fate of their companions. After a careful analysis of these cases, Dr. Bogue draws the following conclusions:

1. The so-called membranous croup and diphtheritic croup are the same disease, differing only in situation, amenable to the same treatment.

2. Tracheotomy should be resorted to in all cases where death is threatened by suffocation from obstruction in the larynx, and as soon as the breathing has become insufficient to sustain the vital powers. It should be performed during the second stage of the disease.

3. It is best to use an anæsthetic; it renders respiration easier by controlling spasm of the larynx.

4. The operation should be done by careful dissection, and, if possible, the trachea should not be opened until all bleeding has ceased.

5. A tube should be used. It causes as little irritation as anything else would, and keeps the wound open better.

6. The room should have a temperature of not less than 75° F., and should be free from currents of air. The atmosphere should be saturated with moisture, by means of boiling water, or the atomizer and this water may be variously medicated to suit individual fancy. In these cases a solution of glycerine in water (1-6) was used, chlorate of potash or carbolic acid being sometimes added.

7. The patient must be *fed*, artificially if necessary. There may be, during the first night, after the removal of the tube, some difficulty in breathing from spasm of the larynx, which will usually be relieved by an anodyne, such as a full dose of paregoric.

In none of the recovered cases has there been any impairment of the voice.—*Chicago Medical Journal and Examiner*, February, 1878.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, May 11, 1878.

THE NEW BILL FOR THE SANITARY INSPECTION OF SCHOOLS.

It is a reason for congratulation with such as have heretofore interested themselves in the sanitary care of the schools, that their labors have not been in vain. A public sentiment has been created in favor of the movement, which promises the best of results, and may eventually overcome the stupid and arrogant opposition of the Board of Education. It is well known that the medical profession has shown the great necessity of providing for the sanitary needs of the school-children, and has conclusively proved that the school-rooms are overcrowded, badly ventilated, are improperly lighted, that the water-closets are filthy, and that the cellar class-rooms and surroundings are wholly unfit for their present purposes. This is an old story, which need not be repeated, even for the sake of refreshing the memories of some who may have forgotten the labors of many of the representative men in our ranks who have contributed so much towards obtaining exact information on hitherto doubtful points. In fact, the necessity for the sanitary care of our school-children has been practically settled beyond the reach of argument to the contrary.

The Board of Education have, however, strenuously opposed every measure which might tend to effect the desired object, and with a vehemence and partisanship which would almost arouse the suspicion that some selfish interests were at stake. Certain it is, with all their desire to oppose the wishes of the profession and the citizens generally, they have as yet advanced no reasonable or fair grounds for the course pursued. The question is apparently such an exciting one to the Board that we almost imagine that it is the red flag in their educational meadow. But every year it is shaken over the fence, and the usual amount of dust is kicked up.

It is not surprising, then, to learn that another school bill is before the State Legislature, and that the Board of Education are ready, as usual, to oppose it. This time, however, the bill has been purely the interpretation of a popular sentiment which has been created in favor of the measures which it advocates, and as such is energetically advocated by its mover, Assemblyman Fitzgerald. Perhaps this fact may of itself tend to cast the burden of proof of interested motives as much upon the Educational Board as upon the people at large. If there is any argument in a majority, the Board this time is on the losing side.

The bill to which we refer is a good one, and we hope, now that its passage has been secured in the Assembly, despite the efforts of the School Board to the contrary, its success in the Senate will be likewise assured. The various provisions contained in it are judicious, far-seeing, practical, and, best of all, inexpensive. If placed upon its simple merits, it cannot fail to impress our legislators in the most favorable light. There is no intricate machinery to secure its success, and no chance for political jobbery and party capital, which, unfortunately, distinguishes many legislative movements ostensibly calculated for the public good. In fact, its simplicity is its greatest merit. In brief, it is merely handing over the sanitary inspection of schools to the Board of Health, and giving the latter the necessary power to act in the premises. It is provided that a sanitary inspector—and of course a medical man—shall be appointed for each school district, and shall visit and report upon the condition of schools while in session, their ventilation, light, capacity, their water-closets, sewers, heating facilities, and, in fact, everything which shall, directly or indirectly, affect the health of the scholars.

All this, however, the Board of Education assume to prove is unnecessary, meddlesome, and calculated to interfere with their legitimate functions and legal authority. Heretofore the Board was bold enough to openly protest against any similar measure; but, since the severe snubbing it has received from the Legislature, it is more discreet, and trusts its defensive measures in the hands of one of its members, whose zeal is as inordinate as it is misapplied, and who, strange to say, is scarcely equal to the occasion.

In a letter published in the *Herald*, this commissioner very deliberately says that the bill is destitute of merit from beginning to end. From one whose opinion on sanitary matters must be very valuable, this is a powerful blow against the bill. The friends of the latter may yet be sorry that he has gone so far towards settling the question of the utility of the measures proposed. But perhaps a weightier argument for his attitude is that public sentiment does not demand any change, that the daily and medical press do not understand the question, and that consequently the Board of Education is abundantly able to look after all its affairs. As sanitary inspection is one of the matters

which it is assumed to be capable of managing, there is the best of reasons in his estimation why the Board should be left alone. But the facts of past history militate somewhat against this view, and tend to make such assumptions a trifle inconsistent. If there is, or has been, no necessity for sanitary inspection outside of what the School Board pretends to be competent of making, why was the Board of Health asked to aid them in this matter? Public sentiment could not have demanded it, for the Board is entirely independent of it; and, besides, there were the trustees and school inspectors, who were supposed to know exactly what was wanted.

It is true that on that occasion the schools were vacated for the summer months, and there could not be much clashing of authority regarding any recommendations to obviate overcrowding, bad atmosphere, or other conditions inseparable from the actual presence of the pupils; but, for the sake of the argument, it is a matter of regret that even such inspections should have been advised. As we anticipated at the time, the recommendations of the Health Board were merely received as an act of official courtesy, duly filed, and, with a very few exceptions, entirely ignored. Now, the present bill provides that the sanitary care of the children shall be delivered to the Health Department, which shall not only be competent to make suggestions, but be empowered by law to enforce them, the Board of Education to the contrary notwithstanding. This appears to be a reasonable measure to all, save those who compose the Board of Education. The matter has now, however, gone so far, and popular attention is so strongly directed in the right current, that this ill-judged and presumptuous opposition may yet fall short of its real object. It would seem, when there was so much difference of opinion regarding sanitary matters between the people and the School Board, that the latter would, if for nothing more than politic reasons, be glad to accept any proposals which might tend to compromise matters and relieve them from any extra responsibilities. As the case now stands, the opposition is inexplicable, and, to those who take an unprejudiced view of the situation, absurd.

The School Board has been ready with its protests; but where are its arguments based upon the real facts of the case? Against their wanton neglect of sanitary precautions, which has over and over been proved against them, where is there evidence that these trustees or inspectors ever attempted to mitigate existing evils, or, if they did, where are the proofs that the Board ever acted upon their suggestion? But if, in answer to such questions, we are informed that the Board is able to look after its own affairs, that any extra sanitary regulations are unnecessary, we presume that all argument is at an end, and we submit accordingly. But, even against such tremendous odds, we still hope that the bill may pass.

THE SO-CALLED TRICHINÆ IN SHAD.

MANY of the daily journals of this and other cities have directed public attention to a statement that the shad of the present season are infested with trichinæ, and a suggestion is volunteered that other species of fish in the bay will also become the host of this dangerous parasite. We intended to pass the matter without comment, feeling that it would be superfluous to explain the absurdity of the rumor, but as we have reason to believe that the public are alarmed and would welcome a specific statement of the case, we present a few observations that may be useful at this moment.

The result of a special investigation undertaken to trace the source of the report, shows that the shad are healthy and free from any dangerous parasite, and that even most careful microscopical examinations which were made, revealed nothing which should prevent us giving these wholesome and delicious fish a clean bill of health.

We believe the report of the presence of trichinæ in fish to have been started by those who have mistaken for it a small, thread-like worm which inhabits the intestines. Having secured several fresh specimens of these worms we can state that they are quite distinct forms from trichinæ, averaging fully three-quarters of an inch in length, and of course distinctly visible to the naked eye. This fact of itself is sufficient to disarm all suspicion of trichinæ, and from the start carried a conviction of error upon its face by the singularly innocent statement of the would-be discoverer to the effect that he had no microscope with which to make any minute investigations.

We should describe the worms found as belonging to the order of free nematoideæ, called Anguillulæ; these are found almost everywhere, and abound in the surface-mud of rivers, aquatic plants, etc.; the marine species are not parasitic, perfectly harmless in their nature, and are removed from the fish, as a matter of course, in the process of cleaning.

We may remind our readers that the nematoid group is divided into two divisions, the first, including such formidable and well-known human parasites as the celebrated trichina, the Guinea worm, and the ascaris lumbricoides, and a host of others of more or less note, and *secondly*, of a class still more numerous, which are not parasitic at any period of their life, and lead a free existence. The worms we observed belong to the second class, and never become encysted, and can, therefore, never be mistaken for trichinæ. Much interest is attached to the history of the family of Anguillulidæ, which is known to include over 180 varieties, and numerous workers are in the field, among whom we may name Dr. Cobbold, of England, and our own Professor Leidy.

In regard to trichinæ we may mention the fact that M. Colin confirmed the observations of Fuchs and Pagenstecher that it is only in mammals that the

trichinæ are enabled to pass into the muscular system and remain imbedded there, preserving their vitality. If such is the case, fish can be eaten with perfect safety and without fear of the trichina. We trust these remarks will dispel any prejudice that may have arisen in consequence of the pretended discovery of these parasites in shad.

THE DISSEMINATION OF INFECTIOUS DISEASES BY MEDICAL MEN.

DR. WHITMORE, the medical officer for Marylebone, a large western district of London, has taken occasion, in a recent official report, to refer to the question of the dissemination of infectious diseases by medical men. While he speaks with some confidence as to practitioners among the upper and middle classes of society carrying out the precautionary measures necessary to prevent themselves becoming carriers of infection, he appears to cast a doubt upon medical men who practise among the poorer classes, as he admits there are numerous difficulties in the way of their taking equal precautions.

In reference to special cases of attendance upon lying-in women, he offers the following advice: "Every medical man, when in attendance upon these persons, should, if possible, give up his attendance upon patients suffering from contagious and infectious diseases; or, if that cannot be done, there should, in the first place, be an interval of several hours between his visits to the latter and the former, and, in addition, his clothes should always be changed."

The *Lancet* asks, "Where is the data that would justify advice of this sort, calculated to excite unlimited alarm among the public? The conditions under which infectious diseases are propagated are surely sufficiently known in these days for a medical man to avoid being a carrier, without suggesting that he must virtually close practice." "Take the phenomena of the propagation of puerperal fever in the now happily rare instances in which the medical man is the propagator—propagation probably not more common among the poor than among the rich. We protest against the vague advice of Dr. Whitmore."

In regard to this matter we presume that members of the medical profession are fully alive to the danger that undoubtedly exists of propagating diseases, the *Lancet* to the contrary notwithstanding, and that they are impressed with the duty of taking the most radical precautions of mitigating the evil. This is as it should be, and is one of the principal means of proving the rarity of instances in which the carrying of infection has been traced to medical men. Even in cases of doubt the physician owes it to his conscience always to be on the safe side. Irrespective of the dictates of humanity the profession have direct personal reasons for taking the fullest precautions in regard to these special cases, for a total disregard of them on the part of a physician would probably carry the infection to the members of his own family.

POISON IN THE NURSERY.

THE constant production of toilet novelties suggests a word of caution to those who purchase them. An analyst writes to the *Lancet* that on making a chemical analysis of a packet of violet powder, he found, much to his astonishment, that it contained 25 per cent. of white arsenic.

In this instance the use of the powder had caused an epidemic among young children, many of whom died, the disease presenting every appearance of erysipelas. Here were mothers, while applying an innocent-looking toilet powder to their children, positively introducing into their systems a deadly and subtle poison.

Our readers may remember that during the recent trial in London of the notorious Madame Rachel, evidence was given that a violet powder sold by her contained a powerful irritant, which produced an unpleasant rash on the skin.

Comment upon these facts is unnecessary. Probably our readers will accept the hint to purchase such things in future from houses of undoubted respectability.

Reviews and Notices of Books.

HANDBOOK OF THE PRACTICE OF MEDICINE. By M. CHARTERIS, M.D., Professor of Practice of Medicine, Anderson's College, Glasgow, etc. Philadelphia: Lindsay & Blakiston, 1878.

PRACTICAL GYNÆCOLOGY. A HANDBOOK OF THE DISEASES OF WOMEN. By HEYWOOD SMITH, A.M., M.D., Oxon., etc. Philadelphia: Lindsay & Blakiston. 1878.

THESE compact volumes belong to a series of handbooks in the different departments of medicine, arranged for the benefit of students and others who are in need of ready references and abstract statements of facts. Both are well arranged, admirably condensed, and thoroughly practical. We have no doubt that they will prove of great utility to the student while in attendance upon lectures and during the time when it is desirable to refresh the memory previous to examinations.

LANDMARKS, MEDICAL AND SURGICAL. By LUTHER HOLDEN, F.R.C.S., etc. From Second English Edition. H. C. Lea. 1878.

THE title of this little work is very suggestive of its practical value, while the perusal of the work itself verifies the most extravagant expectations. The object of the author has been to collect in compact form the landmarks or surface-marks of the different parts of the body, and indicate their relation to the deeper-seated parts. The value of this sort of knowledge to the physician, but especially to the surgeon who, with an anatomical eye, can make the tissues transparent before him, is incalculable. The mapping out of the human body is one which is most instructive to the practical man, and he is enabled, after considerable

experience, to have landmarks of his own; but in the little work before us this knowledge is systematized in such an intelligible manner as to place it within the reach of all. It is one of the most interesting little works we have seen for a long time.

LESSONS IN LARYNGOSCOPY, INCLUDING RHINOSCOPY AND THE DIAGNOSIS AND TREATMENT OF DISEASES OF THE THROAT. By PROSSER JAMES, M.D., M.R.C.P., etc. 2d Edition. London: Ballière, Tindall & Cox. 1878. 12mo, pp. 176.

THIS second edition is virtually a reprint of the first with the advantage of a careful revision and the increased artistic value to the admirable plates. It is well calculated to maintain its former reputation as a class-book and a comprehensive guide to the general practitioner who may desire to become a practical laryngologist.

A MANUAL OF NURSING. Prepared for the Training-school for Nurses attached to Bellevue Hospital, N. Y. Putnam & Sons. 1878. 12mo, pp. 142.

THIS manual has been prepared for the Committee of the Training-school for Nurses attached to Bellevue Hospital, by Dr. Victoria White, and is really a model in its way. It evinces, in a most striking manner, a thorough knowledge of the wants of the professional nurse, and also a capability of ministering to them. Some idea of its contents may be gained by a reference to the following chapter headings: Qualifications of a Nurse—Hospital Management—Observation of the Sick—Administration of Medicines, in which are included Directions for Giving Enemata, Hypodermic Injections, Passing the Catheter, etc.—Applications, which include Poultices, Sprays, Cupping, Blisters, etc.—Dressing of Wounds, including Hints on Bandaging—Operations—Points regarding Special Cases—Articles Required in Emergencies—Monthly Nursing—Nursing of Sick Children—Hygiene of Children—Cooking for the Sick, etc., etc. It is in fact one of those works concerning which it may be said much attention is paid to little things, and much pains are taken to give them the real importance which they deserve.

At the risk of reflecting upon the knowledge of the younger members of the profession concerning minor details, we presume to recommend to them the perusal of this work in the possible hope that they may be much benefited thereby.

TRANSACTIONS OF THE AMERICAN NEUROLOGICAL ASSOCIATION FOR 1877. Edited by E. C. SEGUIN, M.D. Volume II. New York: G. P. Putnam's Sons.

THIS is the second publication of the Society, and comprises a number of papers read during the sessions of 1876 and 1877, and from their diversified character the reader is presented with a volume of great interest. We regret that there is nothing from the pens of Wood, Pepper, Bartholow, and others of the Association, who are better known to the profession than the majority of writers whose articles appear. Weir Mitchell contributes but a page or two, and his short, able paper is finished by the reader in a short space of time, while other members of the Society are each represented by three or four long articles. This is a feature of society reports which we have often commented upon, and it seems to be the rule that variety should be sacrificed.

The articles in the volume before us which seem most worthy of mention are those of Drs. Emerson, Schmidt, Gibney, Seguin, Webber, Miles, Mitchell, and Hun. Dr. Emerson's paper upon Syphilitic Sciatica is very exhaustive and well written. It has been his aim to prove that syphilitic sciatica is not so rare a disease as it is generally supposed to be, and that it is usually due to pressure made by neoplastic growths upon the nerve-trunk. Dr. Gibney writes upon Spinal Irritation (it would be well if this vague term were expunged from the nomenclature of nervous disease), and considers it to be the result of a localized subacute meningitis of the cord, and that there is usually some history of traumatism. His observations throw much light upon the history of the trouble, but cannot be accepted in their entirety. An article by Dr. Hammond, headed "The Odor of the Human Body," is of a somewhat sensational character. The author considers the pathological conditions which are attended by an emanation of a "violaceous" perspiration. Dr. Hammond, whose well-known accuracy and experience in matters of scientific research enables him to speak with authority, found that in three cases an odor comparable to that of the pine-apple was "exhaled from the left lateral half of the anterior wall of the chest," "from the skin of the head and neck," and "from various parts of the body." In a fourth case the odor was not so agreeable, and resembled that of Limburger cheese.

Dr. Hammond carefully collected the sweat and treated it as follows: "With this object in view, I covered the affected side of the chest with a perfectly clean cambric handkerchief while the perfume was being evolved, and when it was well saturated with perspiration, and thoroughly redolent with the peculiar odor, I placed it in a glass retort, into which I introduced four fluid ounces of proof spirit. This was allowed to stand for several hours, and then distillation was effected at a temperature of 120°, and was continued till about one-fourth of the fluid contents had passed over into the receiver. This distillate was very strongly impregnated with the perfume of violets, as will be distinctly perceived in the portion contained in the vial which is now exhibited." This Dr. Hammond found to be butyric ether.

Dr. Schmidt's article upon the Intimate Structure of Nervous Ganglionic Bodies is a truly scientific paper, and impresses the reader at once that the author is a most modest and industrious student of neurology. Dr. Schmidt found that two different kinds of processes arise from each sympathetic ganglionic body, and he considers that these have different functions because of a dissimilarity in structure. Dr. Beard presents many interesting facts in regard to the prevalence of endemic tetanus, and produces much valuable statistical and other information. Dr. Beard is inclined to indulge in a looseness of phraseology which is inconsistent with the exactness which is indispensable in making scientific statements; for example he says, "The pathology of tetanus I take to be in general *a cold* in the spinal cord."

Dupuy's articles do not possess the merit of novelty, but are quite interesting, and display the author's familiarity with the views of Brown-Séquard, his teacher. Dr. Webber's article upon the Forms of Paralysis which follow certain Acute Diseases, is exceedingly good. Dr. W. presents many cases of cerebro-spinal meningitis, puerperal fever, typhoid fever, etc., so complicated, and an admirable review of the literature of the subject is appended, so that the article is quite complete. The report is quite equal to that of 1875, and is a valuable addition to the library of the neurologist.

TRANSACTIONS OF THE AMERICAN MEDICAL ASSOCIATION. Vol. XXVIII. 1877.

FULL reports of the June meeting which have previously appeared in THE MEDICAL RECORD leave little

to be said as to the published volume, save to call attention anew to the value of some of its papers to medical men, and to specify some of their conclusions, which may possibly have been forgotten in the press of medical business. Dr. A. B. Palmer's notes as to the "Effects of Quinine in Acute Pneumonia" will strike the eye of the average practitioner, particularly at a time when the loss of some of our ablest medical men from that disease is still fresh in the public mind, and as the cases of successful treatment of the disease are in extraordinary disproportion to knowledge of its processes of development, progress, and termination. The "Report on Animal Vaccination," by Dr. Henry A. Martin, Mass., with a reproduction of the celebrated drawings of Denoup Decantelen, Paris, of vaccine cicatrices, is a thorough and exact theoretical and experimental review of the whole subject. After carefully testing a series of vaccinations with vaccinia from the five hundred and seventieth animal of his own series, and the eight hundred and thirtieth from the original case of Prof. Depaul, of Beaugency, France, and comparing them with vaccinations performed with matter that has passed through fewer transmissions, Dr. Martin concludes that vaccinia arising from original cow-pox transmitted through a series of selected young cattle, is less liable to lose its properties than vaccine matter which has been obtained from the human pustule. He has never observed the violent inflammatory and erysipelatous complications, so numerous when the original cow-pox matter or that of very early human removes is employed, in cases in which the vaccine has been many times transmitted through selected bovines. Our esteemed contributor, Dr. Ezra M. Hunt, of New Jersey, has one of those thorough papers on "State Medicine and Public Hygiene," by which he has earned such an enviable distinction in the literature of sanitary science; although in this instance he limits himself almost too rigidly to a discussion of views that have recently arisen, and consequently draws too little upon his own abundant sources of information. Dr. Cabell, of the University of Virginia, treats the "Etiology of Enteric Fever" from the standpoint of the germ theory, rather assuming it provisionally, however, than accepting it as a scientific demonstration. Dr. Bell's paper on tubercular disease in cattle is another noteworthy article, and one that introduces a new factor into the etiology of consumption. Dr. Lewis A. Sayre's fine paper on "The Treatment of Fractured Ribs," and Dr. Lee's on "Suspension in Spinal Distortion," should be carefully studied by surgeons.

DIAGNOSIS IN PATHOLOGICAL ANATOMY, with Directions for making Post-mortem Examinations. By JOHANNES ORTH, First Assistant in Anatomy at the Pathological Institute in Berlin. Translated by FREDERICK CHEEVER SHATTUCK, M.D., and GEORGE KRANS SABINE, M.D. Revised by REGINALD HEBER FITZ, M.D., Assistant Professor of Pathological Anatomy in Harvard University. Sole authorized English edition. New York: Published by Hurd & Houghton. Boston: H. O. Houghton & Co. Cambridge: The Riverside Press. 1878.

THIS volume, containing 425 pages, has two general divisions: 1, appearances presented by external examination of the body, or *inspection;* and 2, appearances presented by internal examination, or *section.*

The external examination embraces inspection of the body as a whole, and the inspection of its several parts. The internal examination is divided into four parts: 1, the spinal cord; 2, the cranium; 3, the thoracic and abdominal cavities; and 4, the extremities. The author proceeds, under the head of inspection of the body as a whole, to direct attention to general attributes, such as relate to age, sex, stature, frame, general nutrition, and general character of the skin. Under this head he has described the gross appearances of the various growths which appear on the skin and cellular tissue beneath it, and with the exception of an occasional appearance of the word microscopically for macroscopically, the descriptions are all that could be desired in a work of this kind.

We next come to the internal examination, and we find that the three great cavities of the body are examined in their successive order from above downwards: 1, cranial; 2, thoracic; and 3, abdominal. The author gives as a reason for beginning with the head that the amount of blood in the brain and its membranes may be determined before section of the great vessels in the neck. The abdominal cavity, it is said, should be opened before the thoracic, but its examination may be postponed until the examination of the contents of the thoracic cavity has been completed. In cases in which it is necessary to determine whether a new-born child has breathed or not, the examination should commence with the thoracic and abdominal cavities. The order preserved throughout the book is, first, inspection; second, description of method of opening cavities and removal of organs; third, description of general appearances; fourth, description of special morbid conditions. In this manner the author has succeeded in presenting to the profession a systematic work upon the method of making post-mortem examinations, and also upon the gross appearances exhibited by all the organs and tissues when in a diseased condition. The basis of the volume is the regulation introduced by Virchow into the Pathological Institute at Berlin. In the introduction reference is made to the preliminaries necessary to the proper performance of autopsies, the instruments required, and a description is also given of the chemical and microscopical appliances necessary to make a complete microscopic examination. The book doubtless, as it is claimed, represents the teaching of Virchow, and for this reason, if for no other, it has, as the reviser states, "a strong claim for consideration." Its careful study will inevitably benefit the man who has occasion to make an autopsy.

VORLESUNGEN ÜBER ALLGEMEINE UND EXPERIMENTELLE PATHOLOGIE, von DR. S. STRICKER, o.ö. Prof. der allgemeinen und experimentellen Pathologie in Wien. 1 Abtheilung. Wien, 1877. Wilhelm Braumüller.

THIS work is to be published in three parts, of which the first only has reached us. The part before us contains eleven of the series of lectures, and deals chiefly with the essence, causes, duration, and terminations of disease. Five of the eleven lectures are devoted to the consideration of infectious substances and contagion, not too large a proportion, when the importance of the subject is taken into consideration. The author gives brief historical sketches of the rise and progress of the different opinions and theories concerning infection and contagion, furnishing a concise and instructive résumé of the steps which have led to the present state of our knowledge of the subject. This portion of the work contains, however, little that is new. Neither can it be said to present an exhaustive scientific consideration of the subject, but it furnishes, in an attractive and readable form, much information that will be valuable to busy practitioners, who have not had time to follow the gradual advances of this branch of medical knowledge. The causes

and modes of death in disease are treated in a very satisfactory manner. One statement made by the author, in speaking of artificial respiration, we do not remember to have seen elsewhere; it is that compression of the larynx of an animal apparently dead from suffocation or poison, will cause a deep inspiration. Dr. Stricker has repeatedly observed this. It would be premature to attempt an analysis of the merits of the work from the small portion of it that is before us, but it certainly promises to be a welcome and valuable addition to medical literature. The lectures are written in an easy and attractive style, and in this respect, at least, contrast very favorably with many of the recent additions to German medical literature.

TRANSACTIONS OF THE COLLEGE OF PHYSICIANS OF PHILADELPHIA. Vol. X. Philadelphia: Lindsay & Blakiston. 1877.

THIS volume of the *Transactions* contains the papers read before the college from October, 1876, to July, 1877, which, however, are published with the understanding that the college is not responsible for the statements or opinions set forth in them. The papers are apparently published in full, but no account is given of the discussions following the reading of them. Among the most valuable of the published papers, is one by Prof. J. J. Reese, on the "Post-mortem Imbibition of Poisons, more especially in its Medico-legal Relations," and one by Prof. Wm. Pepper, on the "Internal Administration of Nitrate of Silver." Dr. Robert Harris is the author of a very interesting essay on "The State of Medicine in China." Among the other papers we may mention one by Prof. da Costa, on "Relapses in Typhoid Fever," one by Dr. Lewis, on "The Ophthalmoscope in Medical Diagnosis," and one by Dr. Mears on subcutaneous section of the humerus and the formation of a false joint in the treatment of old dislocations of the shoulder. The *Transactions* are as usual printed on good paper and in good type, forming a handsome book of over 200 pages.

TRANSACTIONS OF THE KENTUCKY STATE MEDICAL SOCIETY. 22d Annual Convention, held at Louisville, April, 1877. Louisville: John P. Morton & Co. 1877.

THIS volume of the Transactions of the Kentucky State Medical Society contains little that will interest the profession outside of the State of Kentucky. The report of the proceedings of the Society is full, and no doubt satisfactory, but of that we cannot pretend to be a competent judge. The papers published are numerous, but most of them are short and sketchy, and none of them can be said to possess a really scientific character. To our mind the best thing in the book is the address of the President, Dr. Gaines, of Hopkinsville. It touches briefly on many subjects of general as well as local interest, and is written in a flowing and attractive style that makes it pleasant reading.

SPINAL DISEASE AND SPINAL CURVATURE: Their Treatment by Suspension and the Use of Plaster-of-Paris Bandages. By LEWIS A. SAYRE, of New York, Professor of Orthopædic Surgery in Bellevue Hospital Medical College. London: Smith, Elder & Co. J. B. Lippincott, Philadelphia. 1877.

THE treatment of disease of the spinal column, whether caries or lateral curvature, has always been unsatisfactory to the general practitioner, on account of the difficulty in obtaining a properly fitting instrument for the former, and from a want of a clear understanding of the cause in the latter class of deformities. A plan, therefore, of giving support that could be applied by the surgeon himself, and be under his control, has long been sought for.

At the meeting of the American Medical Association, in 1876, Dr. Sayre read a paper on the treatment of Pott's disease by means of a plaster-of-Paris jacket, and since then has advocated the treatment of that disease exclusively by this means. Last summer he went abroad in order to bring to the attention of English surgeons "the efficacy of the plan of treatment I have of late *devised* and carried out," and while in England compiled the volume under review. The greater portion of the book consists of a reprint of the paper mentioned above. The book consists of two parts, that on spinal disease, by which term Dr. Sayre means caries of the spine, and that on lateral curvature, or as our author calls it, "rotary curvature of the spine," diseases totally different in their pathology and mode of origin.

And first in regard to spinal disease. He begins by giving a short account of the pathology, in which he claims a strictly traumatic origin, and "rejects altogether the view held by the profession in general, that Pott's disease is, above all others, one of essentially strumous origin," but he admits that it occurs frequently in tuberculous subjects. The more we see of disease of the vertebræ, the more are we impressed with the view that it is much more frequent among those who have inherited a vitiated constitution from their parents, or have acquired such a diathesis, and that there *is* a strumous element in spinal disease.

He does not seem to be aware of the fact that disease may begin, and even be entirely confined to the intervertebral disks, the bone being not at all, or only slightly, involved in the disease.

In naming the symptoms he has omitted to give those of disease between the first and second cervical and the occiput, where the pain is in the course of the occipital nerves, and *not* in the neck or throat, and may be mistaken for neuralgia of these nerves. On page four he speaks of "reflex muscular contractions," as an early symptom of caries of the spine: he then goes on to explain what he means by "reflex contractions," namely, "that every joint of the lower limbs *is bent for the purpose* of preventing any concussion from affecting the bodies of the inflamed vertebræ." We are unable to see that there is anything "reflex" about this, and it is a misnomer to call it so. On page eight, in speaking of paralysis of the limbs, he states that it is more common "when the disease involves the lower portion of the spine, and when the nerves that are given off to the lower extremities have become affected."

Post-mortem examinations have demonstrated that pressure on the nerves is *not* a common cause of paralysis, and that loss of power is a more common accompaniment of disease high up than low down. Again, he states "that paralysis depends either upon effusion into the cord or upon pressure through displacement of the vertebræ; . . . . that in the former instance the condition of the paralyzed limbs will gradually improve; . . . . in the latter the prognosis, so far as restoration of power is concerned, is very unfavorable."

Post-mortem examinations prove that direct bony pressure is very rarely met with. The investigations of Charcot, Michaud, and others in regard to secondary affection of the spinal cord in the course of Pott's disease, seem to be entirely unknown to the author. The prognosis in regard to recovery from paralysis in the course of the disease under consideration, is not HOW the pressure is caused, but on the amount of SECONDARY changes in the cord. Having expressed his

views in regard to the pathology and complication met with in disease of the vertebræ, he goes on to state the indications for treatment. On this point there can be no difference of opinion. Good and firm support to the inflamed bones, so as to give absolute rest to the parts, is demanded.

For this purpose he advocates the use of a plaster-of-Paris jacket, which he claims to have devised. His description of the mode of application is clear and easily followed. It seems to us that it is better adapted to disease in the lumbar and middle dorsal region than when the upper dorsal and cervical vertebræ are involved. When the disease is above the fifth or sixth dorsal vertebræ, our main support must depend on holding up the head, and for this purpose we think that a well-fitting brace with chin-piece is better. We have always found the chin-piece devised by Dr. C. F. Taylor to give good support, and at the same time so slight a disfigurement that we can hardly recommend the ungainly contrivance that Dr. Sayre calls a "jury mast." If, however, the use of suspension for the head is desired, the chin-piece used by Dr. Benj. Lee, of Philadelphia, is a much more elegant apparatus. Whether a plaster-of-Paris jacket is better than any other mode of support in all cases, is a question that each surgeon must decide for himself. That it has its disadvantages is evident from the troublesome ulcerations that have occurred under the bandage, even in so skilful hands as Dr. Sayre's, and from the impossibility to keep the skin in good condition. We very much doubt whether cures are more rapid after treatment by means of the jacket than with any properly fitting brace that gives good support. There is one point of great importance that Dr. Sayre has failed to mention, and that is, leaving off all support too soon. We have seen cases where the bones were evidently anchylosed, but after a time the old pain had reappeared, and treatment had to be begun again, much to the disappointment of both physician and patient. It is altogether too soon to decide upon the real value of the plan advocated by the author.

The second portion of the volume is devoted to the treatment of lateral curvature of the spine. He begins by giving what he calls his former explanation of its cause, but neglects to state that Barwell brought forward the theory that he now claims as his own. He now adopts the theory of rotation suggested by Dr. A. B. Judson, who, in a very able paper read before the Academy of Medicine in 1876, considered that "the immediate cause of the curvature is an inability to support the superincumbent weight." Any suggestion as to the cause of lateral curvature that leaves out the explanation of the fact that it is much more common among females than males; that the curvature, in curves primary dorsal, has its convexity to the right; that it is more common in the temperate zone than in hot climates, must be looked upon as unsatisfactory. Among those who carry heavy weights on their heads this deformity is almost unknown. Our author advocates almost the same plan of treatment for this disease that he does for angular curvature, namely, a plaster-of-Paris jacket, and suspension for cases at all advanced. We think that the theory on which the above plan of treatment is based is wrong, and although a plaster-of-Paris jacket may relieve the pain in old and marked curves, we do not think that it will diminish their amount. In regard to suspension, it seems to be a good mode of exercising the muscles, and might be adopted with benefit in many cases. In old rigid curve we do not think that any mode of treatment promises much relief.

We very much question the good taste of the photograph of the author appearing so frequently in illustrating the application of the jacket, as well as the many letters from friends of the patients who have been under Dr. Sayre's care, speaking in such extravagant terms of the value of the mode of treatment and expressions of the hope that the author will be "eternally rewarded" for the great benefit he has conferred on those afflicted with spinal disease. They add nothing to the value of the work, and had much better have been left out.

The purpose of the book is to demonstrate the mode of applying the plaster-of-Paris jacket, and this Dr. Sayre has done in a manner that leaves nothing to be desired. His descriptions and directions are so clear that any one can easily follow them, and for this purpose we cordially recommend the book to the profession.

STUDIES IN PATHOLOGICAL ANATOMY. By FRANCIS DELAFIELD, M.D., Adjunct Professor of Pathology and Practical Medicine, College of Physicians and Surgeons. Nos. 1 and 2, February and March, 1878. Wm. Wood & Co., 27 Great Jones Street, New York City.

JUDGING from the two numbers before us, they might very properly be called illustrated annotations in Histology, as the first of them is taken up with matters relating to the connective tissue group, and the second gives us the anatomy of the pleura. It has always been of primary importance to get clear ideas about connective tissue corpuscles and the intermediate tissue, and a number of excellent observers have directed special attention to these matters. As a natural consequence old ideas have been materially modified. It seems to be natural, therefore, that Dr. Delafield should commence at this point, and he does so by giving us a number of excellent drawings of tissues that he has prepared in certain special ways. A point of particular interest appears to be the results obtained from a triple method of staining, viz., with osmic acid, hæmatoxylin, and eosin, showing conclusively, as it would appear, that the so-called lymphatic spaces are totally distinct from the connective tissue corpuscles. His views as to the forms of these bodies are much like those first stated by Waldeyer, though he would seem willing to include the endothelium of serous membranes among the essential elements of the connective tissue which it covers. In regard to the anatomy of the pleura the views of Dybkowsky and Klein are corroborated in the main. The drawings are the main features of the work, there being but few pages of text, which is mostly explanatory of the views which are advanced. The work gives promise of being a valuable contribution to the histological literature of the day, and reflects credit upon the liberality of the author, and his careful and accurate methods of work.

PATHOLOGICAL REPORT OF THE MONTREAL GENERAL HOSPITAL, for the year ending May 1, 1877. By WILLIAM OSLER, M.D., of McGill University. Vol. I. Montreal: Dawson Brothers, publishers, 1878.

THE author, in dedicating this little volume of 97 pages, announces that it is the first pathological report from a Canadian hospital, but it is one which is not only highly creditable to the author, but should set an example to the staff of other hospitals throughout the country. The more interesting cases out of one hundred autopsies during the year are recorded, together with a few from private practice. The author has clearly followed the systematic plan laid down by Virchow, and has given us the fruits of it. Cases are arranged in groups, while to many the chief clinical

features are added, with valuable references. In many the histological examination has been thoroughly done with satisfactory results. Two records of pernicious anæmia are remarkable in this particular.

Reports of Societies.

NEW YORK NEUROLOGICAL SOCIETY.

Stated Meeting, April 1, 1878.

DR. E. C. SEGUIN, PRESIDENT, IN THE CHAIR.

DIGITI MORTUI—DEAD FINGERS.

DR. THOMAS A. MCBRIDE read a brief and interesting paper upon the above subject. It contained the history of a case that had come under his care, a *résumé* of the literature, the etiology, and the pathology of the peculiar condition.

In a man æt. 32 years, and of neurotic constitution, certain parts of the index and middle fingers of both hands, also of the end of the ring finger of the right hand, at irregular intervals and for varying periods became cold, of a dead-white paleness, numb, stiff, had some loss of sensibility, and were moderately painful. These symptoms were replaced by a dusky, often purplish-red color of the same parts, was accompanied by the sensation as having been stung by nettles, and soon after the affected portions of the fingers regained their normal appearance. These phenomena appeared to occur independently—occurring when the patient was otherwise healthy as well as when sick. No similar phenomena had been observed elsewhere in the body. Fatigue, exposure to a draught of cold air or to cold water, and possibly the emotions, had seemed to act as exciting causes.

The phenomena were explained on the ground that there was *vascular spasm* involving arteries, capillaries, and veins. The *treatment* consisted chiefly in the use of the galvanic and Faradic currents, and alternate douches of hot and cold water.

Literature.—The disease was first described by Brodie in his lectures on "Local Nervous Disorders," published in London, 1837, but delivered some years before. It had since been referred to by Huston, in 1836; Raymond, in 1862, 1872, and 1874; by Nothnagel in 1866; Estlander, in 1870; Fischer, in 1875; and by Dr. Allan McLane Hamilton, in the New York *Medical Journal* for October, 1874.

Symptoms and Course.—The development of dry gangrene from *digiti mortui* was rare. According to Raymond, the condition usually preceded what he had called local asphyxia, which might be acute or chronic. If acute, it might go on without any disturbances of nutrition, but more commonly gangrene, more or less localized, occurred, and sloughs of considerable size might form; or, what seemed more common, was that, after a small amount of gangrene had occurred, the local asphyxia disappeared, and cicatrization followed. In the chronic form, lasting for some months, there might be localized gangrene followed by cicatrization, as in the acute; but more commonly there were manifested other alterations in the nutrition of the parts, so that the skin became much thickened and indurated.

Pathology.—In speaking of the pathology, Dr. McBride was of the opinion that the condition was produced by the action of the *vaso-motor* system, but he did not think that the disease was a *vaso-motor* neurosis. He was inclined to regard the condition as one produced reflexly through the *vaso-motor* system, and in his case as being an accident depending upon increased irritability of a certain part of that system; that is, it indicated a nervous system of great mobility, and otherwise had no significance.

The patient had had phthisical manifestations several times within twelve years, but they had not exhibited any activity during the last *four* years. He had also suffered for two months in 1874 from subacute spinal paralysis, but entirely recovered. He had been given to the use of alcohol and to sexual excesses, but had never had syphilis. The paper was discussed by Drs. Hammond, Spitzka, Wells, and Seguin.

The Society then proceeded to the election of officers, with the following result: For President, Dr. J. C. Shaw, of Brooklyn: First Vice-President, Dr. E. C. Spitzka; Second Vice-President, Dr. L. D. Kiernan; Secretary, Dr. Landon C. Gray; for Council, Drs. W. A. Hammond, E. C. Seguin, Max Herzog, and T. A. McBride.

The Society then adjourned.

NEW YORK ACADEMY OF MEDICINE.

SURGICAL SECTION.

Stated Meeting, April 9, 1878.

DR. STEPHEN SMITH, CHAIRMAN.

OCULAR AND ORBITAL TUMORS—MYXO-SARCOMA AND MELANO-MYXO-SARCOMA.

DR. THOMAS R. POOLEY read a brief and interesting paper, which consisted chiefly of the history of a case that came under his observation as Visiting Physician to Charity Hospital. The patient was a woman, æt. 55 years, single, and by occupation a seamstress. There was a marked family tendency to phthisis. The patient, however, had always been remarkably healthy with the exception of suffering considerably from hemicrania. The first manifestation of a tumor, although she had suffered from eye trouble for some time, was a small lump upon the upper part of the left eye-ball. The growth increased quite rapidly. It was situated upon the sclerotic, under the conjunctiva, and was movable. It produced marked exophthalmus, downward and outward. There was atrophy of the optic nerve—optic neuritis of the usual form.

When the patient was first seen, no intraocular tumor could be discovered by the most careful examination. It was proposed to remove the tumor without sacrificing the eye, but the patient left the hospital on the day set for the operation.

The protrusion of the eye increased; the cornea sloughed; the patient returned; the eye-ball was enucleated; and at the same time the tumor, that was attached to the back part of the orbit by a pedicle, was removed. Upon examination, the eye-ball was found to contain a new growth. The specimens were exhibited, were accompanied by microscopic preparations made by Dr. Bettmann, and by sketches of the patient made by Dr. Fridenberg, House Physician. Both tumors were examples of myxo-sarcoma; the orbital growth only was pigmented, and to it was applied the term melano-myxo-sarcoma.

Dr. Pooley then entered upon questions relating to differential diagnosis and certain points connected with the operation. The question also arose: How was the presence of the tumor in the eye-ball to be explained, as there was apparently no destruction of

the sclerotic at any point? Dr. Pooley thought it probable that the growth had extended from the orbital tumor to the eye-ball through the opening made in the cornea. In conclusion, Dr. Pooley raised the question: Was there any predisposition to the formation of malignant tumors in those subjects who had a hereditary tendency to phthisis?

Dr. Webster referred to five cases of melano-sarcoma of the eye that had fallen under his observation. In all the cases the disease returned, and made its appearance either in the orbital cavity or in some of the internal organs. He was inclined to the opinion that the ocular tumor in Dr. Pooley's case was metastatic.

Dr. Spitzka thought it was the prevailing opinion among pathologists that there was a special tendency to the formation of malignant growths in those who had a marked hereditary tendency to phthisis.

On motion, Dr. Pooley's paper was referred to the Academy, and the Section adjourned.

New Instrument.

A MODIFIED ATOMIZER.

For Use in Antiseptic Surgery.

By FRANZ HEUEL, Jr., M.D.,
NEW YORK.

The apparatus represented in the accompanying cut is a modified apparatus for use in antiseptic surgery. The modification consists in the addition of two flexible rubber tubes and a steam-chest to the ordinary atomizing apparatus used for inhalation purposes, and may be readily attached by the physician himself to any of the atomizers now used. In the annexed figure, 4 is a steam-chest, to the upper part of which is soldered, at 3, the ordinary metal atomizing tubes, and at the side a tube, 1, to which is to be attached a piece of flexible rubber steam tubing, for carrying steam from a boiler; opposite 3 is a wooden handle, 7, for holding the apparatus, and at the lowest part of the chest is a stop-cock, 5. The rubber tube, 2, delivering

the medicated fluid, is also furnished with a stop-cock, 6, so that the amount of fluid atomized may be varied at pleasure. The steam and water tubes, 1 and 2, are held together by figure-of-eight pieces of wire, so that they may be handled as if they were but one tube.

As is readily seen, the length of these tubes may be varied to suit the occasion, only remembering that the longer the tubes, the greater the pressure of steam required, and the higher must the vessel containing the medicated fluid be placed in order to deliver it at the opening of the tube, 2. The steam, which condenses in the tubing and steam-chest, is allowed to escape, when necessary, through the stop-cock, 5, so that the patient is not scalded by a jet of hot water.

The use of long flexible tubes, combined with the steam-chest, permits the boiler of this apparatus to be placed at such a distance that all danger of explosion, when ether is used, is avoided, as well as all interference with the operator. The force, amount, and direction of the spray can also be varied at pleasure. In the ordinary atomizers the whole apparatus must be placed unpleasantly close to the patient; in this a very light portion is readily supported and directed by the hand without fatigue.

Correspondence.

THE MEDICAL PROVIDENT SYSTEM.

To the Editor of The Medical Record.

Sir:—A circular of "Out-Patient Department of the Good Samaritan Hospital" was delivered at my office a short time ago. If the by-law quoted is a fair interpretation of the "Provident System," I certainly am not a supporter of that system. $1,100 annually is a sum quite sufficient to support a family of three or four persons, and enable them to pay their physician at least $1 a visit. Such a plan as therein suggested, carried into the other departments of medicine, would only tend to undervalue still further medical skill, and render more difficult the early years of the young practitioner.

I number among my patients many whose income is less than $12 per week, who, I am persuaded, do not feel themselves overcharged at $1 a visit. The fact is, Doctor, that were it not for the hope which those physicians entertain of increasing their private practice through such enterprises, they would be exceedingly backward in countenancing such institutions. The New York Hospital is a case in point, where a sick man can obtain probably the best medical or surgical skill in this city, board, room, etc., for $15 per week; professional services charged as 0. Those gentlemen dispense their skill, which, by the by, in consultation with the ordinary practitioner is exceedingly valuable, at the hospital, for what? They call it reputation, some of us call it advertising, and were it possible to take from these positions their notoriety, the New York Hospital and like institutions would soon be placarded with the usual notice "To let."

Therefore, it seems to me that the sooner we stop this method of "*aiding the poor*," the better it will be for us, for our profession, and for the very poor themselves who are supposed to be benefited.

Respectfully yours,

"Non-provident Doctor."

Carbolated Camphor in Diphtheria.—M. Soulez reports that he has successfully employed carbolated camphor for some months in the treatment of diphtheria. The agent appears to act directly upon the false membrane by lessening its inherent vitality, and hence prevents the dangerous inflammations that arise from more caustic remedies. He dissolves the camphor in crystalline carbolic acid and alcohol, nine parts acid to one of alcohol, and uses the mixture either alone or combined with an equal weight of the oil of sweet almonds.

INTRA-VENOUS INJECTION OF MILK.

To the Editor of The Medical Record.

Sir:—In view of the great practical importance of the subject, and as a supplement to Prof. Thomas's very interesting paper on "Intra-Venous Injection of Milk as a Substitute for Transfusion of Blood, with Cases," reported in the Record (April 27, 1878, p. 337), allow me to lay before your readers the results obtained by Dr. N. Wulfsberg (Privat-docent. Univ. of Christiania), while working in the pharmacological laboratory of Prof. Marmé, of Göttingen (v. Nachricht. v. d. Königl. Gesellsch. d. Wissensch. u. d. G. A. Univ. zu Göttingen, No. 3, Feb. 20, 1878). He experimented largely on animals, and confirms Prof. Thomas's *practical* suggestions.

Dr. Wulfsberg found that a few minutes after the injection of small quantities (6–8 grammes) of fresh, warm cow's or goat's milk into the external jugular vein of a rabbit, the milk-globules are uniformly mixed with the blood, some of them swimming free, some adhering to the colorless blood-corpuscles. An hour later there are not so many free globules, but colorless corpuscles may be seen which enclose a globule, and still later the number of enclosed globules is found to be much increased; two, three, and even four may be seen within a corpuscle. If the latter can be made to rotate, it is plainly seen that the globule is *within* it, and not merely *adherent* to its external surface. This can be best seen with 300–400 magnifying power, when the red corpuscles are decolorized by acetic acid. In blood drawn a little later one finds continually fewer free, and more and more enclosed milk-globules. Two to six hours after the injection no more free globules are to be found, and very few that are visible in the colorless corpuscles, but—as after a good meal—there is a striking increase in the relative number of the latter. In twenty-four hours the blood is again normal.

When dogs received repeated intra-venous injections of from 70 to 250 grammes of milk, they rapidly lost weight, the majority of them dying soon after receiving the last-named quantity. During life they showed no serious symptoms, but after death unchanged milk-globules were always found in the blood, and in the lungs were found larger or smaller blood-clots. True fat-emboli could not be recognized anywhere; the kidneys were always normal.

When hypodermic injections of milk were given the animals lost flesh; and when they were killed, a few days after the last injection, considerable quantities of the milk-constituents (Milchbestandtheile) were always found at the place of injection.

Another series of experiments was on dogs that had been bled largely. They were found to tolerate injections of small quantities of milk, but after large injections they died, and often on the operating-table. When, after great loss of blood, the heart-sounds became very weak, almost inaudible, they became loud and distinct again immediately after the injection. He next bled animals until respiration and circulation had completely ceased, and then injected milk into their veins. At once rhythmic contractions of the heart, which could be felt, recurred, and soon respiratory movements reappeared. When, after a short time, these ceased, they could be again excited by a second injection, and some of the dogs even barked. Whether this restoration of the heart's action was due to an excitation of the nerve-centres or to a purely mechanical irritation of the organ, is as yet undetermined.

Prof. Thomas says of his second case that when the first injection was made the patient was fairly moribund, and that at each subsequent injection it was the unanimous opinion of all who saw her that death was inevitable within a very brief space of time. It was thought that her life was *prolonged* at least six days by the five intra-venous injections of milk. The quantity used in the first injection, in this case, is not stated, but fifteen, twelve, six, and eight ounces were used in the last four. The third case reported simply proved that milk injected into the circulation was innocuous.

It will be seen that the results obtained by Prof. T. in practice, and by Dr. W. in the laboratory, agree; but the latter holds that as relatively small quantities only can be safely injected, as these induce only a very transitory relative increase of the colorless blood-corpuscles; and as on the other hand the injection of large quantities leads to the formation of emboli in the lungs, which are never caused by the transfusion of blood; and as, finally, we can, when it is at all possible, re-excite the heart's action by harmless means, we cannot rely upon intra-venous injections of milk as the last resort. He thinks that these cannot take the place of blood-transfusions.

Per contra, Prof. Thomas considers that injection of milk into the circulation in place of blood is a perfectly feasible, safe, and legitimate procedure; that it is infinitely easier to perform than transfusion of blood; and that its use should not be limited to cases in which profuse and exhausting hemorrhages have occurred, but recommends it in certain cases of typhoid fever, pneumonia, cholera, etc. In this connection allow me to quote the following from a recent paper by Prof. S. G. Armor:

"In many cases of local inflammatory diseases (not dangerously involving vital organs) the patient often dies, I doubt not, from failure of heart-action, before the local disease can run through its natural history. In all such cases TIME becomes an important element of cure, and the way to get such time is to guard well the 'dead point of danger'—a weak and failing heart."—(Proceedings of the Medical Society of the County of Kings, February, 1878, p. 360.)

We may consider that *shock* enters largely into this tendency to death; could time be gained this shock or condition of collapse might pass off and life be saved. Again, it may aid in the detection and punishment of crime: life might be prolonged sufficiently to allow the victim of an assault to identify his assailant. It may also be applicable in cases of poisoning. George Eliot has already made use of this idea in her story of "The Lifted Veil," published in 1859, in which we are told of a wicked lady whose guilt was brought to light by the experiment of transfusing blood into the heart of a person just dead, who revives for an instant and denounces her.

In the discussion which followed the reading of Prof. Thomas's paper, Dr. Jacobi said that cow's milk, when introduced into the human circulation, should be a little more alkaline than it is naturally, and suggested that it should be made so by the addition of carbonate of soda. A year ago I suggested to Dr. Wulfsberg, with the idea of obviating the possible formation of fat-emboli, that the milk should be saponified by the addition of water of ammonia, so as to break up the globules. As Dr. W., in his investigations, did not find fat-emboli, it is probable that this reason for the use of ammonia is worth nothing; but, as the water of ammonia has been found not dangerous when injected in cases of snake-bite, and as stimulation is usually indicated when intra-venous injec-

tion is required, and for the purpose of producing an alkaline reaction in the milk, as advised by Dr. Jacobi, I repeat the suggestion here.

I have seen or heard somewhere the statement that when the blood of one of the lower animals—cow, sheep, or goat, for example—is injected into the human blood-vessels, the red corpuscles of the injected blood, from the different quality of the human blood, lose their vitality and are soon thrown off as effete material. If this be true, it follows that the fresh, warm, alkaline milk of the cow is a safer article to inject into human veins than her own blood, or that of a sheep or lamb—safer, most probably, than any other fluid except human blood.

Pardon the length of this communication, and believe me most respectfully, etc.,

J. S. PROUT, M.D.

167 CLINTON ST., BROOKLYN, N. Y., May 3, 1878.

THE TREATMENT OF DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—The communications in your journal, from Drs. Billington, Rodman, Willard, and Mundé, have interested me considerably in the subject of "The Treatment of Diphtheria," and the idea kept recurring to my mind while reading their articles on the subject, that somewhere, lang syne, I had read where a German physician had used the tinct. ferri chloras and glycerine mixture, in something near the manner practised by Dr. Billington *et als.* After searching through my little collection of medical journals, I found the article I had read, and thinking it might not prove uninteresting to your readers, I will give you the language of the article, which I find in *The Southern Medical Record* for September, 1871, on page 480, viz.:

"SESQUICHLORIDE OF IRON AND GLYCERINE IN DIPHTHERIA AND CROUPOUS AFFECTIONS.

"Prof. Clar (*Practitioner*, July 1, 1871, from the *Wien Medisin Zeitung*, No. 19, 1871), having experienced the advantages from the application of the best anhydrous glycerine (of Sarg) in various catarrhal and slight croupous and diphtheritic affections, met with some of a much more severe type, which led him to add the sesquichloride of iron to the glycerine with excellent results.

"The method of treatment he adopts, varying of course with individual peculiarities, is the following: He first prescribes a gentle aperient, either in the form of a manna draught, or of a few grains of calomel, which last he holds to be a powerful antiphlogistic remedy, and, when properly used, of great value. Coincidently he directs cold compresses or cloths to the neck and head, or even to the chest, carefully renovated in accordance with the elevation or depression of the temperature, cold or iced water being at the same time given as a drink, and then commences at once the use of iron-glycerine, which consists of two ounces of anhydrous glycerine, and twenty drops of the liquor ferri sesquichloridi. Of this mixture, half a teaspoonful is to be given every half-hour throughout the day and night. As soon as the symptoms appear to be mitigated, the quantity is diminished to a teaspoonful every second hour, and in the intermediate period, with the object of dissolving the exudate, a mixture composed of glycerine, two ounces, borax, twenty grains, is similarly given by a teaspoonful at a time. The iron-glycerine is progressively given at longer periods, and is gradually replaced by the borax-glycerine."

With the exception of the application of the cold compresses, I have tested this treatment in a few cases of what I called membranous croup, with very gratifying results. I have been especially pleased with the prompt and certain action of the borax-glycerine in dissolving the exudate.

Injected into the nose, where the diphtheritic exudation extends to the mucous membrane of the posterior nares, the borax-glycerine mixture will, I believe, be found to act with more certainty, and will give better results as a solvent of the false membrane, and alterative to the diseased mucous surfaces, than most of the complex, shot-gun prescriptions, usually made use of for that purpose.

And if diphtheria is primarily a local disease, and the constitutional symptoms are the result of the absorption of septic matter, the antiseptic properties of borax and glycerine would prove of no mean value in destroying the poison already generated, preventing the further production of septic germs and the systemic poisoning resulting from their absorption. In a word, would prevent septicæmia by destroying the germs—nipping infection in the bud, wherever it is applied faithfully and freely, so that no part of the diseased tissue shall be overlooked.

This treatment, resorted to early, promises as good results in preventing constitutional symptoms as any treatment recommended, is simple, easily given, and to my mind rational. Where constitutional symptoms have developed, this treatment will still be found good as far as its action as a germ destroyer, alterative and solvent of the exudation is concerned. In this country, however, we are accustomed to giving the sulphate of quinia in tonic or antiperiodic doses, owing to the indications for its use. I have never found it necessary to use alcoholic stimulants, but may be under the necessity of doing so in the next case I have to treat. We must be guided by reason, and the lessons taught us by our every-day experience in the treatment of disease, and not be too much wedded to our theories. I think it would be criminal in a physician to withhold stimulants, when the symptoms indicated their use, because of his theoretical disbelief in their utility in a certain disease.

Very respectfully,

J. N. BOYD, M. D.

COOPER, TEXAS.

THE FIRST OVARIOTOMY. — From an article by T. Spencer Wells, F.R.C.S., in the *British Medical Journal*, it seems that that distinguished authority was in error when, in his work on "Diseases of the Ovaries," he ascribed the first successful ovariotomy in Italy to Prof. Londi, of Pisa, September, 1868; the second to Prof. Peruzzi, of Lugo, and the third to Dr. Marzolo, of Padua. Although the operation had not been performed in Italy for half a century when Londi undertook it, it appears that Dr. Emilioni, of Faluza, a provincial surgeon, successfully extirpated an ovary in 1815, in a married woman twenty-six years of age, who had produced a scirrhous tumor of that organ by resting the edge of a heavy pan of water against the abdomen. The extirpated ovary is now in the museum of the Medical Society of Bologna—a pyriform mass of scirrhous degeneration, nine centimetres long by five broad, preserved in alcohol.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from April 28 to May 4, 1878.

PAGE, CHAS., Major and Surgeon. Granted leave of absence for fifteen days. S. O. 36, Dept. of the Platte, April 27, 1878.

RANDOLPH, J. F., Major and Surgeon. Relieved from duty in Dept. of the East, to proceed to his home and report his arrival by letter. Authorized to remain there on monthly certificate of disability until his health is sufficiently restored to resume duty. S. O. 90, A. G. O., April 26, 1878.

YEOMANS, A. A., Capt. and Ass't Surgeon. To proceed to Fort Griffin, Texas, relieve Ass't Surgeon D. G. Caldwell, receipt to him for all property, and, upon completion of this duty, return to Ft. Richardson, Texas. S. O. 89, Dept. of Texas, April 25, 1878.

TURRILL, H. S., 1st Lieut. and Ass't Surgeon. Relieved from duty at Ft. Clark, and assigned to duty at San Felipe, Texas. S. O. 90, Dept. of Texas, April 26, 1878.

COMEGYS, E. T., 1st Lieut. and Ass't Surgeon. Relieved from duty at San Felipe, and assigned to duty at Fort Clark, Texas. S. O. 90, C. S., Dept. of Texas.

PERLEY, H. O., 1st Lieut. and Ass't Surgeon. Granted leave of absence for one month, providing he furnish proper medical attendance, at his own expense, at his station, Ft. Pembina. S. O. 49, Dept. of Dakota, April 25, 1878.

May 4, 1878.....	0	4	69	2	55	41	0

CONTAGIOUSNESS OF SCARLET FEVER.—Dr. J. M. Ward, of Cornelia, Missouri, writes: "Dr. C. E. Billington says in the March 25th number of MEDICAL RECORD that 'the earliest fact in the clinical history of scarlatina is the contagion. While this is exceedingly subtile, permanent, and capable of being carried to great distances, it is at the same time known to be uncertain in its effects.' Wilson says that the cause is a contagion apparently identical with rubeola. Flint says that it is probable that its causation always involves contagion. Now, in the face of the above authorities I must say, that with an observation of some 200 cases I never have seen a case that has shown any evidence that the disease is any more contagious than cholera, diphtheria, or erysipelas. That it is contagious I do not believe, but it may be infectious. The cause must be atmospheric, and the same cause that induces one case may cause forty. With the atmospheric influence operating, and added to the exhalations from a case of the disease, there is stronger action, the same as in diphtheria or erysipelas, and calls for isolation as a prophylactic. Scarlatina is not amenable to the law of contagion, which implies that all unprotected persons will, as a general rule, take the disease on exposure, and that it is propagated in no other way than from an affected person. Rubeola, variola, and parotitis are examples of contagious diseases that conform to that law, and scarlatina is an exception. In the epidemics of scarlatina that I have witnessed, the extent of territory has been limited, while the outbreak was simultaneous in several families who had no communication with each other, and in a rural district. I take stories of the contagion of this disease 'cum grano salis.' For instance, a child died, and the clothing years after communicated the disease, or a letter from a family who had it did the same in a distant part of the country. Is it probable that such statements are true cases of contagion, when you can get no such effect at the time the disease is prevailing in a locality outside of the atmospheric cause, with possibly an added infection from cases of the existing disease? No matter how strong the infection, a large number escape altogether, as Dr. Billington has shown, where he tabulates 100 children in families that had scarlatina in the family, and 43 were affected and 57 escaped, or about as many affected as you might expect of chills in a district strongly malarious. To say that it is not as contagious as rubeola, but that it is the most subtile of all contagions, appears contradictory, and to explain such an anomaly will necessitate a hunt for a cause other than contagion. Both erysipelas and scarlatina seem infectious by contact when the soil is as congenial as in a puerperal woman,* but that don't establish that either are propagated by contagion solely. My impression is, that the scarlatina poison is primarily in the atmosphere and being inhaled, the disease becomes constitutional before there is any local manifestation anywhere. The results of observation make authority, and my observations lead me to discredit the idea that scarlatina is propagated by contagion."

DR. FORDYCE BARKER.—The Board of Trustees of Columbia College did a graceful thing, which will cause great satisfaction in many and widely different circles. They conferred the degree of LL.D. upon Prof. Fordyce Barker, of this city, by a unanimous vote. It is so rarely that such an honor is so deservedly conferred, that the profession at large can take it as a general compliment.

AMERICAN MICROSCOPICAL SOCIETY.—At the Annual Meeting of the American Microscopical Society of the City of New York, held Tuesday evening, March 26th, 1878, the following officers were elected for the ensuing year: President, John B. Rich, M.D.; Vice-President, William H. Atkinson, M.D.; Secretary, O. G. Mason; Treasurer, T. d'Oremieulx; Curator, John Frey.

AMERICAN MEDICAL ASSOCIATION.—The Chairmen and Secretaries of the several Sections of the American Medical Association are requested to send in (by title) the papers to come before them, with the time required for reading; also all gentlemen having papers to present, not referable to the Sections, will send as above, without delay, to

THOMAS F. ROCHESTER,
Chairman of Committee of Arrangements,
Buffalo, N. Y.

*Dr. M. M. Pallen reported a case of puerperal diphtheritis occurring during an epidemic of that disease, but he does not state that the attending physician had been treating diphtheria prior to her confinement.

THE YEAR 1877, NOW COMPLETE, COMPRISES

I.—THE SECOND VOLUME OF SMELLIE'S MIDWIFERY. Edited and annotated by Dr. McClintock of Dublin,

II.—THE MEDICAL DIGEST. By Dr. N. Neale. This work consists of carefully classified references to the contents of the chief London Medical Journals during the last thirty years.

III.—THE SECOND AND CONCLUDING VOLUME OF PROF. BILLROTH'S LECTURES ON SURGICAL PATHOLOGY AND THERAPEUTICS, with Index.

IV.—THE FIRST FASCICULUS OF AN ATLAS OF PATHOLOGY. Compiled for the Society from original sources, by a Committee consisting of Dr. Gee, Dr. Green, Dr. Moxon, Dr. Sutton, Mr. Holmes and Mr. Hutchinson, with descriptive letterpress.

The Series for 1878 will probably comprise the following, but it must be understood that the Council is not pledged as regards this announcement:

I.—BIBLIOTHECA THERAPEUTICA. By Dr. Waring. Vol. I. Nearly Ready.

II.—A SECOND VOLUME OF DR. LATHAM'S WORKS. Collected and Edited for the Society by Dr. Robert Martin. The first volume of this work was issued in 1875, but new members who join from the year 1876 will be allowed to obtain it separately, in order to complete their sets. (Price Five Shillings.)

III.—A FIRST PART OF MAYNE'S LEXICON OF MEDICAL TERMS. This work will be edited and wholly re-written for the Society by Mr. Henry Power and Dr. Leonard Sedgwick. The copyright of the original work has been purchased by the Society, and it will in future be obtained only by its members. The Society's edition will be so much remodelled and enlarged that it will constitute almost a new work.

IV.—THE THIRD VOLUME OF SMELLIE'S MIDWIFERY. Edited by Dr. McClintock.

V.—A SECOND FASCICULUS OF THE ATLAS OF PATHOLOGY. This fasciculus will conclude Diseases of Kidneys and probably complete Diseases of the Spleen and Supra-renal Glands. It will be accompanied by a short *résumé* the present knowledge of the Pathology of Kidney Disease. By Dr. Greenfield. With illustrations from the microscope.

Annual Subscription, $10. Payable in advance.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KERN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 26, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

K. & M.

Granulated Effervescent Preparations

Of Magnesium Citrate, Potassium Bicarb., Citrate, Benzoate, and Bromide; Lithium Benzoate and Carbonate; Cerium Nitrate and Oxalate; Bismuth Citrate (SOLUBLE), Pepsin, and Bismuth; Pepsin, Bismuth, and Iron, etc., etc., etc.; also the following

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1868 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

ESSENCES OF MEATS.

For Invalids, Travelers, and Persons of Delicate Health.

ESSENCE OF BEEF,
ESSENCE OF MUTTON,
ESSENCE OF CHICKEN.

These Essences consist solely of the juices of the Finest Meats, extracted by a gentle heat, without the addition of water or any substance whatever. They contain, therefore, the most stimulating and exhilarating portions of Meats, calculated to invigorate the heart and brain **immediately;** being without any gelatinous injurious elements, which require solution.

They are very effective in cases of **Sea Sickness.** Persons contemplating a sea voyage, or water travel of any kind, will find the Essences invaluable as a nourishing and stimulating preparation. They will be retained by the stomach in very critical cases of illness, when the most carefully prepared soup is rejected. They are also used with very satisfactory results in **Children's** complaints. Our Essences are heavy liquids, and, when placed upon ice, take a jellified form, retaining the fine flavors of the meats, thus making them very refreshing and pleasant to the taste.

Taken Direct from the Can without any Preparation whatever.

USE A DRY SPOON AND LEAVE THE CAN PARTLY OPEN. WILL KEEP IN ANY CLIMATE.

NEW HYPODERMIC SYRINGES.

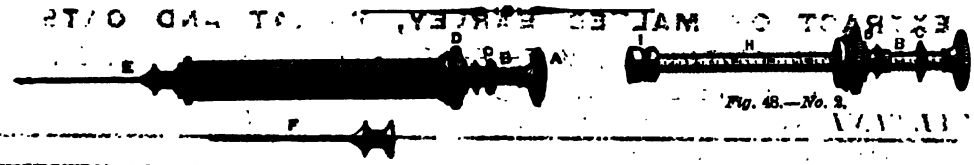

Fig. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, **$4.00.** No. 2, **$4.50.** Postage, .02.
" No. 3, **3.00.** No. 4, **4.00.** " .02.

No. 3.

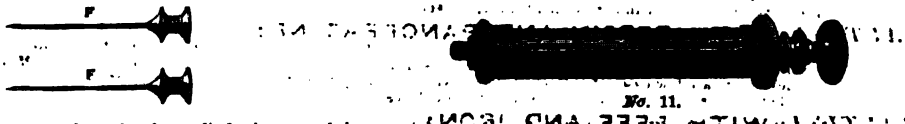
These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case,	$3.00	.02

No. 9.

		Postage.
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, two best steel gilt needles, in neat case,	$3.00	.02
No. 7 or No. 9, with two steel unplated needles, either,	2.50	.02
No. 10, glass, Luer's (French) graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet lined morocco case,	12.00	.02
No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).		



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and, for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case, $3.50 *Postage.* .02

☞ *Any of the above will be sent by return mail on receipt of price and postage.*

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Dr. Garratt's Constant Electric Disks,

That any person may apply and wear with comfort for relief of local *pains* and *weakness*; for old Rheumatic and Neuralgic pains, coldness and stiffness. It is also remarkable for its constant power to help Weak Lungs, Heart, Stomach, Kidneys, Sluggish Liver, Lame Back, and other ills.

While worn, by night or day, this flexible pad is self-charging and applies a fine, constant galvanism that wonderfully cures nervous ills. For the price and purpose, it has no equal. So say physicians, druggists, and those now using this improved electric. Large Disk, $2.50; Children's Disk, $1.00; Long Disk, with straps for the body, $3.50; Do. for large body, $5. Can be sent by mail on receipt of price, by GARRATT & Co., 6 Hamilton Place, Boston, Mass.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,
GALVANIC BATTERIES,
BATH APPARATUS, &c.

--Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery,

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE,

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

This is to Certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS, and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.
Prof. of Chemistry and Toxicology in Bellevue Hospital Med. Col., and Prof. of Chemistry and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,	**With**		**Hops (Plain),**	**$1 00**
"	"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

AN ESSAY ON RECTAL MEDICATION.

By WM. BODENHAMER, M.D.

8vo. Cloth. $1.00.

CONGENITAL OCCLUSION AND DILATATION OF LYMPH CHANNELS.

By SAMUEL C. BUSEY, M.D., Professor of the Theory and Practice of Medicine, Medical Department of the University of Georgetown, &c., &c.

8vo. Cloth. Price $2.00.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

By SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adults."—DR. DESSEAU *in Medical Record, July 28, 1877.*

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

SENT BY MAIL, POSTPAID, ON RECEIPT OF PRICE.

THE ELEMENTS OF THERAPEUTICS.

A CLINICAL GUIDE TO THE ACTION OF MEDICINES.

By DR. C. BINZ, Professor of Pharmacology in the University of Bonn.

Translated from the Fifth German Edition, and edited, with additions, in conformity with the British and American Pharmacopœias.

By EDWARD I. SPARKS, M.A., M.B., Oxon, Member of the Royal College of Physicians of London, Officier de Santé (Alpes Maritimes), France, formerly Radcliffe Travelling Fellow.

In one handsome 12mo volume, bound in extra muslin, price $2.00.

QUAIN'S ELEMENTS OF ANATOMY.

STUDIES IN PATHOLOGICAL ANATOMY.

By FRANCIS DELAFIELD, M.D., Adjunct Professor of Pathology and Practice of Medicine in the College of Physicians and Surgeons; Visiting Physician and Pathologist of the Roosevelt Hospital; Visiting Physician and Curator of Bellevue Hospital.

In Royal Octavo Parts, each containing from two to four full-page Lithographic Plates in tint, and in color, with accompanying explanatory text.

☞ These studies will form, when completed, a treatise on Pathological Anatomy of exceptional value, especially for the remarkable fidelity of the illustrations, their minute and elaborate detail. The Parts will be published regularly, the first of each month, and sent to subscribers carefully rolled, to protect the Plates from injury.

Subscription Price, $5.00 a Year. Single Numbers, 50 cents. Invariably in advance.

☞ *Specimen Copies will be sent on receipt of 50 cents.*

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

Dr. N. Gerber's Milk-Food

Prepared in THUN, SWITZERLAND.

Many farinaceous foods prepared for children contain too much sugar and starch, while the milk added to these foods is insufficient in quantity, so that the proportion between the azote and non-azote bodies is not fairly balanced, and consequently, the children are fed in an irrational manner.

After long experimentation, in which I have sought to avoid this serious defect, I now offer an article which I believe will meet the necessity of the case, inasmuch as it contains **less starch and sugar and more milk.**

DIRECTIONS.

For children up to three months old, one part of the "Food" to eight or ten parts **cold water.** The quantity of water may be reduced for older children to four or five parts to one of "Food." After mixing well, boil it five minutes, taking care to stir it well.

CHEMICAL ANALYSES.

The composition of Dr. N. GERBER'S "Milk-Food" is stated by well-known Chemists, as follows:

THE ANALYTICAL SANITARY INSTITUTION,
LONDON, April 27, 1876.

The results of my analysis show that Dr. GERBER'S Milk-Food is composed in part of condensed milk; that it contains all the elements of a complete food, namely: the Starchy, Saccharine, Albuminous, and Mineral, in such proportions as render the food well adapted for the nutrition of infants and young children.

The amount of Nitrogenous matter and of Phosphoric Acid furnished are considerable.

The Nitrogenous matter includes 1.68 per cent of Nitrogen, and the Mineral matter 0.51 per cent of Phosphoric Acid.

ARTHUR HILL HASSALL, M.D., Chemist,
Author of "Food; its Adulterations, and the Method for their Detection."

MONTREAL, Canada, November 10, 1877.

I have satisfied myself that Dr. GERBER'S Milk-Food is not a mere "Farinaceous Food," but that it really contains, as it professes to contain, the formative elements of *Flesh, Blood and Bone*; also *Carbonaceous Matter* for the maintenance of animal heat,—thus constituting a *complete diet*, formed on the basis and type of Human Milk. * * * I can conceive of no better substitute for "Mother's Milk."

J. BAKER EDWARDS, Ph.D., D.C.L.,
Professor of Chemistry Bishop's College and College of Pharmacy, Montreal, and Public Analyst for District of Montreal, under Inland Revenue Act.

HYGIENIC PHYSIOLOGICAL INSTITUTE.
MUNICH, Summer, 1877.

Repeated experiments of Dr. GERBER'S Milk-Food, made by D. Med. FR. RENK, Assistant of Privy Counsellor Prof. Dr. MAX VON PETTENKOFER, at his Laboratory; also, at Prof. Dr. C. VOIT'S Physiological institute in Munich, show the average analysis to be:

Water,	4.31 per cent
Mineral Salts,	2.03 "
Fats,	5 23 "
Albuminates,	15.51 "
Hydro-Carbons, soluble,	46.41 "
" " insoluble,	24.46 "
	99.95 "

This preparation is highly recommended by:

Prof. DEMME, Physician to the Jenner Hospital for Children Berne, Switzerland.
Dr. J. RUD. SCHNEIDER, Sup't of the Hospital of the Canton Berne, Switzerland.
A. M. SIGEL, M.D., Phys. to the Olgo Hospital Ass. for Infants, Stuttgard.

ROETHLISBERGER & GERBER,
Sole Agents for the United States,
NEW YORK.

This soap is confidently offered to the medical profession and the public, as being a detergent, which, from the nature of its composition, possesses UNDOUBTED HEALING QUALITIES.

It is a preparation of useful VEGETABLE OILS AND REFINED PINE TAR SAPONIFIED, in combination with CHEMICALLY PURE GLYCERINE. We thus produce a detergent absolutely free from the valid objections frequently discoverable in soaps compounded from animal fats, which HAVE BEEN KNOWN to be POSITIVELY INJURIOUS TO THE SKIN.

This soap has already been used in many public institutions: as Nurseries, Infant Asylums, Hospitals, Dispensaries, etc., and abundant evidence, from them and from private physicians, can be given those desiring it, which will bear out all that is claimed for the remedial excellence of PACKER'S TAR SOAP.

In the treatment of

DISEASES OF THE SKIN,

this soap is of especial service: first, because while other soaps, if used, may and probably will exercise some injurious effect, this is the *least irritating of all* soaps; and second, because by virtue of its TAR and GLYCERINE, of which it contains a very large percentage.

SURGEONS find it the best soap for cleansing wounds, ulcers, etc., and for antiseptic and deodorizing purposes.

We feel the utmost confidence that the expectations of the physician will be uniformly realized, if a little pains is taken to designate PACKER'S in cases where TAR SOAP is indicated.

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

" Ferri Pomate, " " " " $1 00

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,
Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rózsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother-liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchona Alkaloids. Quinidia, Cinchonidia, Cinchona, Quinicidin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academie de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolated Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BERIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of Ether; Chloroform; Oil of Turpentine; Apiol;
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

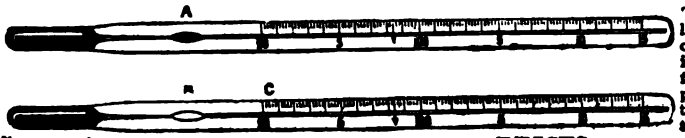
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertance in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 18, 1878, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Second of October, 1878, and end about the 1st of March, 1879.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge*.

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Practical Anatomy Fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	20 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

In corresponding with Advertisers please mention **The Medical Record.**

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DORHMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

Instruction, Retreats, Private Hospitals, &c., &c.

At MT. SINAI HOSPITAL, OUT-DOOR DEPARTMENT,

By PAUL F. MUNDE, M.D.,

For graduates only. Course 12 lessons of two hours each. Fee $30.00.

For further information, apply to

DR. MUNDÉ, 20 West 45th St., New York.

NEW YORK STATE INEBRIATE ASYLUM,

Binghamton, Broome County, N. Y.

This Asylum is admirably situated, overlooking a fine section of country, and is complete in all the appointments of a first-class home, with ample means to meet the wants of every case. It is located three miles from the city, and removed from all temptation. Its management is the same as all other State charities, under the control of a Board of Managers appointed by the Governor. The law provides for the maintenance of indigent inebriates, similar to that of the insane, but patients from other States may be admitted.

The experience of this Asylum, for the past ten years, indicates an increasing usefulness and necessity for such institutions, and the original intention of making this an Asylum Hospital, where this disorder may be thoroughly understood and treated on broad scientific principles is nearer realized than ever before. All rules are strictly enforced, and no patient permitted to go beyond the Asylum grounds without permission from the Superintendent, or in the care of an attendant.

The Charges for Board will include medical care, washing, lights, fuel, etc., with ordinary attention. The exigencies of each particular case will be acted upon, as it may present itself, to those of moderate and limited means as well as the rich.

All inquiries and applications for admission should be addressed to the Superintendent.

DANIEL H. KITCHEN, M.D., Superintendent,
Binghamton, Broome Co., N. Y.

WILLARD PARKER, M.D., New York, N. Y.,
President Board of Managers.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface).....**$0.25.**
Capillary Tubes,.....**1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets.; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

Drs. ROBBINS & LEWIS, 94 Pineapple Street, Brooklyn. *Quote* MEDICAL RECORD.

Rigollot's Paper

is not (as certain storekeepers of bad faith pretend) a production that any one can make;

Rigollot's Paper

is not manufactured with a mustard that every one can buy;

Rigollot's Paper

is one of the most marvelous discoveries of the contemporary pharmacopœia;

Rigollot's Paper

is the invention of M. P. Rigollot who is the exclusive owner, and is the only preparation of the kind which obtained a medal and diploma at the Philadelphia Exposition.

It is sold wholesale at

No. 24, Avenue Victoria, Paris.

All other mustard leaves which do not bear the signature of P. Rigollot are but imitations of his remarkable invention, and should not be bought.

Rigollot's Paper

is the only one adopted by the Civil and Military Hospitals throughout the whole of Europe.

To be had of all the principal Chemists and drug stores in the world.

Insist that the Signature is on each leaf.

P. Rigollot

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 3, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 1, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the *Medical Department of the United States Army.*

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS

By SIDNEY RINGER, M.D.,
Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price, - - - - $4.50

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"The author, as we have said, designed the book simply as an introduction to Therapeutics for the use of students and young practitioners. That to such it will be found most useful there is no doubt; but we are also sure that, from the mass of valuable, readable, and well-arranged information it contains, and the numberless minor practical hints scattered throughout its pages, the work will be almost equally useful to the busy practitioner; and that it will receive from the profession generally the warm welcome which it deserves."—*British Med. Jour.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on therapeutics."—*St. Louis Med. and Surg. Journal.*

WILLIAM WOOD & CO., Publishers,

27 Great Jones St., New York.

NOTICE. It will please many of our readers to know that the firm of Hegeman & Co., whose failure we noticed in January, have again resumed their business. Mr. Geo. B. Marcher, who for twenty years had charge of the wholesale and manufacturing business of the establishment, has been associated with the concern, and the business will again be carried on as before, at 203 Broadway.

Editorial "New Remedies," April Number.

HEGEMAN'S
STANDARD
PREPARATIONS.

CORDIAL ELIXIR OF CALISAYA BARK, a pleasant and agreeable Tonic for dyspepsia, etc.; for persons living in Fever and Ague districts, it will be found invaluable as a preventive.

FERRATED ELIXIR OF BARK, the most perfect Iron Tonic; a pleasant cordial, containing the active principles of Calisaya Bark and Iron.

TOLU AND LIVERWORT EXPECTORANT, a speedy and certain cure for coughs, hoarseness, and all diseases of the throat and lungs.

GENUINE MEDICINAL COD LIVER OIL, for Consumption, Scrofula, Rheumatism, etc. Our Oil has stood the test of twenty years, and thousands of patients attribute their recovery to its use. It is warranted pure.

NUTRITIVE TONIC.

BEEF, WINE AND IRON.—Our *Nutritive Tonic* is prepared from Extract of Beef, Pure Sherry Wine, and Citrate of Iron, combined with a pleasant form; and, in all cases where an efficacious Tonic is desired, it will be found a most valuable preparation. It is extensively used in all sections, and highly recommended by the most eminent physicians.

HEGEMAN'S
COD LIVER OIL AND LIME.

The name of this Compound of Medicine is undoubtedly well known to very many; in fact, the combination of the Genuine NEWFOUNDLAND Cod Liver Oil and Phosphate of Lime, as prepared by us, has a world-wide reputation as the most potent remedial agent in the treatment of that scourge of our country—Consumption—and more prevalent in our climate than any other section in the world.

We have spared neither pains nor expense in the manufacture of this preparation, and its superior quality is shown in the fact that wherever it has been introduced it has superseded all others.

CHAPPED HANDS AND FACE,

Sore Lips, Dryness of the Skin, &c., &c.,

Cured at once by HEGEMAN'S CAMPHOR ICE WITH GLYCERINE. It keeps the hands soft in all weather. See that you get HEGEMAN'S Sold by all Druggists. Price 25 cents; sent by mail for 30 cents.

MANUFACTURED ONLY BY

Strychnia	1-60, 1-40, 1-30 gr.
Sulphur, Iodide	1-25, 1-10 gr.
Tartar Emetic	1-100, 1-90, 1-4 gr.
Zinc, Phosphide	1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

SOLUBLE PILLS.

170 WILLIAM STREET, NEW YORK, October, 1876.

THE marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia and other recognized formulas, has induced us to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

The best substances are used in their manufacture. No article required by a formula is omitted on account of its high cost, nor are any pills deficient in weight; so that we can guarantee them to be made in strict accordance with the standard formulas, *both as regards the materials called for and in weight.*

The pills are coated while soft, and the excipients employed are such as preserve a mass readily soluble in the juices of the stomach, thus insuring prompt action.

The coating, which is soluble and so transparent as to clearly reveal the color of the mass, effectually covers the nauseous taste, and renders the pill easy to be swallowed. Its solubility can be readily tested by allowing a pill to rest upon the tongue for a few seconds.

Particular attention is called to our Granules of Morphine, Strychnine, Arsenious Acid, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in the form of accurately weighed and ready for administering, has long been recognized. We have taken every precaution to secure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon.

We shall be happy to furnish any samples that may be desired.

NOTICE—See our Advertisement in alternate numbers of the M. D.

Original Lectures.

ON GONORRHŒA.

A CLINICAL LECTURE DELIVERED AT THE COLLEGE OF PHYSICIANS AND SURGEONS, CITY OF NEW YORK.

By F. N. OTIS, M.D.,

CLINICAL PROFESSOR OF GENITO-URINARY DISEASES.

(Reported for THE MEDICAL RECORD.)

LECTURE I.

GENTLEMEN:—To day we enter upon a consideration of the third and last in the list of venereal diseases alluded to in the opening lecture of our course, viz.:

GONORRHŒA.

Gonorrhœa is a vicious, non-specific, contagious, inflammatory disease of the mucous membranes.

It is characterized by free purulent secretion without ulceration, occurring chiefly in the mucous membrane lining the urethra in the male, and the vagina and urethra in the female; and occurring exceptionally in the mucous membrane of the rectum.

By transference through *mediate* contagion from these points, the disease may be conveyed to the mucous membrane of the eye.

The occurrence of conjunctival gonorrhœa is by means of *mediate* contagion; that is to say, by the application of the poison through some intermediate substance, as the fingers, sponges, cloths, etc. This is one of the gravest accidents that can occur in consequence of gonorrhœal affection.

The transfer of the disease in the same manner to the nares and to the mouth is alluded to by authors, but I have never seen such cases, and believe they are so rare that, practically, we need not give them much consideration.

This disease is termed *vicious* on account of the acuteness of its onset, as compared with idiopathic or traumatic inflammation of mucous membrane, and from the greater disturbance, local and general, which marks its course.

It is termed *non-specific*, because it is capable of being originated by a variety of causes quite independent of a gonorrhœal origin, and even of the venereal act.

This is an important statement, but one which is capable of thorough substantiation by clinical proof, as will be shown hereafter. It is however, as a matter of course, denied by those claiming a specific venereal virus as the essential, the one sole efficient agent in the establishment of a true gonorrhœa.

The disease is called *contagious* and *inflammatory*, because pus, the product of this variety of inflammation, when brought in contact with sound mucous membrane, sets up in it at once an inflammatory process of a similar character.

It is usually communicated through illegitimate venereal contact; yet a similar inflammation of mucous membrane, producing pus which possesses equally the element of contagion, may arise from causes purely inflammatory. Thus, mechanical irritation, caused possibly by the introduction of a urethral sound, may set up an inflammation producing a purulent secretion, which, when brought in contact with healthy mucous membrane, will develop a disease in no respect different from acute gonorrhœa the result of venereal contagion.

Allow me to relate a case which bears upon this point. Some four years ago, a gentleman came to me, suffering from irritation at the neck of the bladder, as evidenced by discomfort in that region, and also a certain amount of irritation in the glans penis. He was a man entirely above suspicion of illegitimate venereal indulgence. He was under my direct observation for at least four or five months, before I came to the conclusion that his difficulty was dependent upon the influence of a contracted meatus urinarius. I had already made a thorough examination with reference to the presence of stone in the bladder and prostatic enlargement, and found neither. I incised the meatus so that the contraction was completely removed, and with it immediately, to my great satisfaction, the frequency of micturition ceased, and all sense of discomfort disappeared. The only after-treatment necessary was in keeping the opening patent. An ordinary sound was introduced some four or five times. The case was doing very well. But the gentleman had a large business to look after, and, finding it exceedingly inconvenient to come to my office, begged the privilege of using the sound himself. I objected, and yet yielded to his wishes, inasmuch as I did not see why he should not be able to perform the operation, if a reasonable amount of care was exercised. I gave him a *new* instrument, a solid glass rod of proper size and shape, and directed him to pass it well through the meatus every morning, and to do it carefully.

At the end of about a week he came to me with his penis considerably swollen and inflamed. A slight muco-purulent discharge was exuding from the meatus.

In reply to my inquiry he stated that he found some difficulty in introducing the instrument, that this increased daily, until finally, "determined not to be beaten by it," he had carried it in with some degree of violence. The condition which his penis presented was the result. Nothing could be more certain than that this inflammation was the result of mechanical violence. The inflammatory action increased and extended as in an ordinary gonorrhœa resulting from an impure venereal contact, and finally involved the deeper portions of the urethra. He was even threatened with prostatic abscess, but after confinement in bed at least four or five weeks, he recovered with slight remaining discharge. This discharge continued for some time; it was exceedingly slight. Thus far the case would have been placed under the head of ordinary simple urethritis, which by many is considered as entirely different from gonorrhœal urethritis, and especially so as lacking the element of contagion.

During the summer the discharge from the meatus disappeared almost entirely, and under the impression that there was no danger of communicating his disease, he had a single connection with his wife.

About two weeks after, the wife came to me, suffering with a well-marked, acute *vaginitis* which had extended to the urethra. She was a lady over fifty years of age, and entirely above reproach. To my mind, there was no doubt whatever but that she acquired the disease from her husband, whose disease was of traumatic origin. The result of this intercourse was a disease which could not be distinguished from that which is acquired from a known gonorrhœa. I have, besides, seen several cases which, equally with the one now related, go to prove that a contagious secretion from mucous membrane may be present as the result of simple causes wholly independent of contagion.

GONORRHŒA IDENTICAL WITH INFANTILE LEUCORRHŒA.

Another cause of an inflammation of mucous membrane, which does not vary in any practical degree from gonorrhœal inflammation, is infantile leucorrhœa. This is recognized by all authorities as a contagious disease of the mucous membrane. A similar vaginitis may be communicated from it to other children, when the same sponges or bathing-cloths are used, and an ophthalmia is not rarely set up by means of it, which cannot be distinguished from true *gonorrhœal* ophthalmia.

This form of leucorrhœa is caused, as generally believed, by irritation in a contiguous organ, the rectum. It has also been attributed to the irritation produced by teething. But, whatever the cause may be, an inflammation is set up in the vagina of the infant, which produces a discharge that cannot be distinguished from a gonorrhœal discharge, and which may communicate a similar disease.

Some time since a lady called upon me, accompanied by her little daughter (between nine and ten years old). She stated that the child was suffering from a *bad disorder*, which she believed had been communicated by a young man, intimate in the family, who had been in the habit of playing with the little girl. The visit to me was for the double purpose of obtaining relief for the child and securing some advice as to the way of punishing the young man. On examination the vulva was seen intensely reddened, and bathed in a profuse, greenish, purulent discharge. The hymen was perfect, with no sign of injury. The integument around the anus was irritated as if by scratching, and great itchiness in the vicinity was complained of. The rectum was found loaded with ascarides. The cause of the leucorrhœa was thus satisfactorily explained without implicating the young man. Suppose, however, the youth had been subjected to an examination, and had chanced to have an old gonorrhœa—the probabilities would have been greatly against his being able to establish his innocence before any jury.

Here we see that the question as to the specific character of gonorrhœa may become of first importance from a *medico-legal* point of view.

GONORRHŒA PRODUCED BY INJECTIONS.

During my term of service as Resident Physician on Blackwell's Island, twenty-five years ago, several experiments were made with reference to the question of the causation of gonorrhœa by other means than by contact with gonorrhœal discharge. At the instance of Dr. William Kelly, Physician in Chief, various materials were injected into the urethra of healthy individuals, but without satisfactory results, so far as producing gonorrhœa was concerned. Finally, the experiment was made with pus taken from the eye of a child suffering from acute ophthalmia, and a virulent gonorrhœa was established, which continued for four or five weeks, and was attended by the ordinary complications of gonorrhœa, œdema, chordee, etc. Here certainly the disease was produced entirely independent of gonorrhœal contact.

GONORRHŒA PRODUCED BY THE DISCHARGE ACCOMPANYING STRICTURE.

There is still another cause of gonorrhœa that must be mentioned, in order to make this part of our subject complete.

It is a very important fact that a discharge which does not at all differ from true gonorrhœa may arise through contact with the discharge produced by the mechanical irritation incident to *stricture of the urethra.*

A man who has a stricture, but has had no discharge whatever from the urethra for several years, is suddenly placed in circumstances under which an unusual amount of excitement is present in the circulation of that locality; for example, he gets married. A few days after marriage—and I am not now drawing upon general experience or imagination, for I am relating the history of a real case—the man discovers that he has a discharge from his urethra precisely similar to one of his early gonorrhœas. Naturally enough, he does not associate the presence of the discharge with the fact that he had disreputable connection, followed by disease, some years previously. The only explanation which seems possible is, that it has been contracted from his bride. He becomes greatly excited, but before openly disgracing the apparent criminal, he goes to his physician to secure a trustworthy witness of her guilt. The physician, however, knowing of certain wild oats sown in earlier life, tells him to pause before he concludes that his wife has been unvirtuous. An examination is made, and unmistakable evidence of *stricture* is found. The conclusion is readily reached that it had been in existence for some time. This becoming appreciated as a sufficient cause of the trouble, the man at once gives up all suspicion regarding the impurity of his wife.

Within a few days, however, the *wife* begins to complain, and very soon has a sharp attack of vaginitis, and then comes her turn to enter complaint. The discord, however, is finally harmonized through an understanding that the original difficulty with the husband had been acquired several years before. The fact which I wish to make clear is this: that by excess in drinking, sexual intercourse, mechanical irritation, etc., a simple purulent discharge may be elevated to the point of contagiousness; that when raised up to that point it is no longer simple, and will communicate gonorrhœa when brought in contact with healthy mucous membrane.

INFLAMMATION OF MUCOUS MEMBRANE.

Before proceeding farther with our subject, it will perhaps be interesting to study the subject of inflammation of mucous membranes somewhat in detail.

Mucous membrane is made up of several layers: the uppermost or epithelial, the basement membrane, and the areolar tissue layer. In the mucous membrane of the urethra the epithelium is chiefly in the form of laminated scales, and the secretion which is associated with it is the result of the gradual development of this scaly layer. Formative germinal cells come up laden with germinal juices, which, as the cell develops into the epithelial scale, exude and lubricate the canal, thus protecting it from the action of the acrid secretions that pass over its surface. This is the natural process by which the fluid is obtained that is necessary for lubrication, and the quantity in health is never sufficient to constitute a discharge. Any *discharge* from the urethral mucous membrane is pathological, with a single exception, and this is the slight transparent exudation from the meatus urinarius, which sometimes comes on through venereal excitement. In the normal development of the epithelial layers there is just enough material furnished for the gradual development of the germinal cell into the complete epithelial scale. But set up an irritation, and nature responds to such irritation by sending up an excessive supply of "pabulum." The upper layers of cells are detached with greater rapidity than in health,

there is consequently an increased quantity of mucoid or lubricating material thrown out, and we have the first signal that a pathological process is coming on. This process continues, and within a short time the germinal cells appear upon the surface of the mucous membrane as a discharge. If you examine a urethral secretion when inflammation is present, you will find it to consist largely of cells which to all appearances are the same as the white blood-corpuscles. They are not normal white blood-corpuscles, however, but cells which have been emasculated by too rapid development. They retain the power of proliferation and movement, but they are incapable of elevation into useful tissue, and finally emerge from the urethra as a discharge that is called pus. These cells may appear in such quantities that we see them as a profuse discharge, and in the highest stage of the inflammation this discharge has a greenish color, which indicates the additional presence of red blood-corpuscles.

Beale says that when this inflammatory process has gone on for a little time, a kind of proliferation of cells takes place upon the surface in addition to those which come up from the tissues beneath, and that the rapid disintegration of material produced in this manner gives rise to the infective element of the discharge. Cells thus proliferated constitute what he terms *disease germs*, and he claims that they may be produced in this manner, that they retain life with great tenacity, and may be carried for a long distance, and yet when brought in contact with a healthy mucous membrane, will set up an inflammation of like character as that from which it originated. Whether this view is correct or not (and we will consider it at a later period), we have sufficient knowledge to state that pus, under certain circumstances, becomes highly irritant and contagious; that a mild form of inflammatory product may become changed to that which is contagious. The theory advanced would certainly explain the contagious character of gonorrhœa, and also the different varieties of the disease with which we meet.

You will remember that last week a man came before us who had a profuse purulent discharge from the urethra. That discharge was acquired through venereal contact about five or six days before his visit here.

On questioning him, it was found that he did not suffer from pain at all, and that except for the discharge, he was not able to say there was anything the matter with him. At the time I called your attention to the fact that it was one of the milder varieties of gonorrhœa. There was, perhaps, no question regarding the origin of the disease, and yet I doubt very much whether that discharge would, if placed in contact with healthy mucous membrane, have communicated gonorrhœa. The grade of inflammation was low, and so low, that it is a question whether its products were capable of establishing an inflammation of like character. But let that man go on a drunken spree, or have excessive sexual intercourse, you would find that his discharge would become painful. If, then, it was brought in contact with healthy mucous membrane, you would see developed a corresponding discharge, and an active contagious property would be present. There are, therefore, two varieties of the affection: 1. That in which there is a slight, painless, purulent secretion. 2. That in which a higher degree of inflammatory action is present, which gives rise to pain and a greenish purulent discharge.

A man may come to you complaining of an almost white purulent discharge, and at the same time saying that the connection had been with a woman whom he knew to be free from gonorrhœa. Perhaps the additional statement will be made that she was suffering from the "whites," or that she had just completed her menstrual period. If you do not interfere with the discharge, it will disappear within four or five days, as a rule, and the man will be well. But the trouble is that, as soon as a man sees a drop of pus at the meatus urinarius, he goes to a doctor, who attempts, in very many cases at least, to abort the gonorrhœa. A solution of nitrate of silver is employed as an injection, and if that is kept up for four or five days, a sharp urethritis is usually established. I do not believe there is any such thing as aborting true gonorrhœa. Gonorrhœa runs its course, and lasts about four weeks, and any urethral discharge that exists for a less period, I should be willing to say was not gonorrhœa.

I have seen a large number of urethral strictures, and I have made it a point to look up their origin, and to learn concerning the disease which gave rise to them, how the gonorrhœa was acquired, and how it was treated. I have not yet found a single case, which recovered within four weeks, where the symptoms were such as to convince me that the patient suffered from a gonorrhœa *that had been acquired from a gonorrhœa*. In every instance in which the evidence was positive upon this point, the gonorrhœa has lasted at least *four weeks*. There are many cases of gonorrhœa in which the patient, on account of his youth or extreme modesty, neglects to seek professional advice, and yet these very ones pass through their trouble in about the same time as those who avail themselves of eminent professional service. I do not give much credit to the plans which have been brought forward for shortening the duration of the disease, be the treatment what it may. Treatment may aggravate the case, and it may also make the patient much more comfortable than if the disease is left to pursue an unmodified course. The urine can be made less acrid by a variety of means; the distressing symptoms, such as chordee, etc., may be relieved; but as to cutting the disease short, I do not believe that it can be done.

HEPATIC CYST.

Cyst of Broad Ligament and Absorption of Contents—Anteflexion following Abortion.

A CLINICAL LECTURE,

By T. GAILLARD THOMAS, M.D.,

At the College of Physicians and Surgeons, New York.

HEPATIC CYST.

Gentlemen:—I have the pleasure of bringing before you to-day one of the most interesting cases that we have seen during our whole course this winter. The patient comes from Pennsylvania, and it is to the kindness of Dr. P. F. Mundé, of this city, that I am indebted for being able to present her to you, since he has prevailed upon her to come here to-day in company with her regular medical attendant. She unfortunately speaks no English, but her physician will kindly put us in possession of all the necessary facts in the history of the case.

The patient's name is Laura F., a native of Germany, and thirty-one years of age. She has been married six years, and has had three children, but no miscarriages. Her last child was born thirteen months ago, and the duration of her present trouble is nine months. About nine months ago, her physician informs me, she first noticed a swelling in the right hypochondriac re-

gion. From the situation and character of the tumor, which was, perhaps, of the size of a goose-egg, he concluded, very naturally, that it was the distended gall-bladder. She had some trouble in her digestion, being obliged to take food frequently, as she was able to eat only a small quantity at a time, and complained of great pain at the time of her menstrual periods.

Previously she had been perfectly healthy in every respect. After that the doctor did not see her until a comparatively short time ago, and he then found that the tumor had enormously increased in size, and that the woman was not as strong as formerly.

To-day we find the enlargement, whatever its character, to be of the size of a pregnant uterus at the end of seven and a half or eight months, as I can show you through the patient's clothing. The chief point in connection with the case is, of course, to decide what this tumor is, and on that another depends: When we have ascertained its true character, what treatment shall we adopt for it? Its general appearance is that of an ovarian cyst, but we will not jump at any conclusion. I shall make the diagnosis very carefully here, for the reason that I believe this to be a form of cyst which is very rare, and which is very different from an ovarian cyst, and therefore it is important that you should get the characteristics of the case strongly fixed in your minds.

When you see such an abdominal enlargement as this, a number of ideas as to what it may possibly be at once present themselves. Let us now take up briefly some of the forms of enlargement which it might be, and in doing so we will omit certain extremely rare kinds of abdominal tumor.

First of all, I have no doubt the idea of pregnancy occurs to you. It is thirteen months since the patient's last child was born, and so it is altogether possible that another fœtus may now be at full term.

Again, it might be an ovarian cyst, and, as I have said, it presents very much, indeed, the appearance of one.

Then, again, it might be a uterine fibroid.

Next, it might be due to abdominal dropsy.

In the next place, it might not be a tumor at all, but simply an accumulation of fat in the abdominal walls.

Still further, it might be due to tympanites.

In examining whether the enlargement may not be dependent on some one of the several conditions suggested, let us begin with the last—tympanites. The question of tympanites is at once definitely settled by resorting to percussion over the surface of the tumor. When this is done, we find that there is everywhere the most complete dulness, amounting to absolute flatness; and we can therefore safely conclude that we have to deal with some body which is certainly not aëriform in character.

An immense mass of fat has been mentioned as a possible explanation of the tumor here present. I once performed ovariotomy in a case in which the diagnosis was somewhat obscure in certain respects, and when the incision was made into the abdomen I found a deposit of fat at least four inches in thickness in its walls. But if there were a mass of fat, it would be superficial, so that by grasping the abdominal walls deeply with the fingers, we could get under it, which is found to be impossible here. Then, again, great obesity would scarcely be suspected from such a history as has been given of this patient.

Now, let us see whether the diagnosis of pregnancy will stand the test of physical exploration. I examined the uterus thoroughly by conjoined manipulation, and finding it entirely undeveloped, apparently, ventured to introduce the probe, when I ascertained that it passed easily to the fundus, and that the canal of the organ was only of normal length. In addition, the woman has continued to menstruate regularly every month.

Might it not be a uterine tumor? Probably not, because we have been able to map out the size and shape of the uterus, and are able to move the organ freely about by means of the uterine sound without producing any effect upon the tumor. Then, uterine tumors are almost always solid in character, and here we get a distinct sense of fluctuation.

Is it ascites? Suppose you place some intestines in a tub of water. They will at once rise to the top. So here, if we had ascites, and the woman were lying on her back, the intestines would float on top. But listen to the percussion-note on the site of the tumor There is perfect flatness everywhere, while upon the left side, on the contrary, there is well-marked tympanitic resonance. We must, therefore, exclude ascites. It is true that localized peritonitis will occasionally shut up fluid in some particular part of the abdomen, surrounding it with a wall of lymph. In such cases a differential diagnosis between this condition and ovarian cyst is often exceedingly difficult, and one might almost be considered excusable for opening the abdomen with a view to performing ovariotomy; but still, such a mistake will seldom be made if all the means at our disposal for making the diagnosis of ovarian disease are employed.

From the physical characteristics of this tumor we can decide with considerable certainty that it is a fluid cyst of some sort. We have ascertained by means of the sound that it is entirely distinct from the uterus. Is it then an ovarian cyst? Such was my impression when I first saw the tumor; but, on making a careful examination, I found two points in connection with it which militated very strongly indeed against such an hypothesis. The first was, that I was utterly unable to feel the tumor with the finger in the vagina. The force of gravitation usually keeps the inferior part of these ovarian growths low down in the pelvis, where, of course, they originate. The second point was that, on making percussion carefully up and down the abdomen, on the side of the tumor, I was able to make out a distinct area of resonance between the latter and the position of the ovary. Then, besides, it is a very rare thing to find an ovarian cyst localized like this. They are forced by the muscles wherever there is the most room for them, and so they are almost universally found in the middle of the abdomen, though always commencing in the side.

When I found that it was not an ovarian cyst, my next thought was that it was one of those localized peritoneal dropsies of which I have spoken. But I soon found that it was movable to a certain extent (though not very freely), which would not have been the case with such a collection of fluid surrounded by walls of inflammatory lymph; and then there has been no history whatever of any attack of peritonitis, either general or circumscribed.

The next thing that will probably occur to you is that it is a renal cyst. Several cases of tumor of this description have been cut down upon, under the idea that they were ovarian, even by men of the most distinguished reputation. It is certainly possible that this may be the diagnosis here, though I think it is not probable.

The question still comes up, therefore, What then is it? There is still another kind of cyst of which I have not yet spoken, and that is the *hepatic cyst*, the

growth being connected directly with the liver itself. It is so exceedingly rare, however, that it is scarcely mentioned in medical literature at all. A professional friend of mine, who is admirably qualified to do so, has looked up the subject very carefully in the books and journals, and has been able to find almost nothing in regard to it. I do not, of course, now refer to the hydatid cyst of the liver, which is well known, but am speaking of the pure hepatic cyst. That it is a condition which we may be liable to meet with occasionally, however, is certain. Not long since a young surgeon in a neighboring place told me that he was about to perform his first ovariotomy, and a short time afterwards I learned from him that when he had opened the abdomen he found both the ovaries perfectly healthy, but that there was an enormous cyst of the liver, in which there was nothing whatever like hydatids.

I think I am therefore justified in suspecting the presence of an hepatic cyst in the present instance, and in order to derive what assistance we may from an examination of its contents, I have drawn off a small quantity of the fluid by means of the hypodermic syringe. You observe that it is opaque, and of a strongly marked yellowish color; and Prof. Dalton has pronounced it to contain the coloring matter of the bile (not bile itself, you understand, but its coloring matter, at all events). You see the reaction with nitric acid upon this plate. I do not think it can be a hydatid cyst, as there have been none of the features of this condition present. I take it to be an hepatic cyst which is very close to the gall-bladder, and whose contents have, therefore, become tinged with its coloring matter. It seems probable that a process of exosmosis has taken place. It could not be the enlarged gall-bladder itself, for it is impossible that that should become so enormously distended. One other point corroborative of the supposition of the cyst's being connected with the liver is the fact that, on percussion, there is no line of resonance whatever between the liver and the tumor, there being one continued area of dulness from the upper border of the liver to the lowest point of the growth; while, as you remember, there is a line of resonance between the latter and the pelvis. In addition, I find that the left lobe of the liver is very large and prominent, so that it can be mapped out with great distinctness, and the hand slipped under it, as is usually the case when there is a large fatty liver. It would, at all events, indicate some diseased condition of the organ.

Having at length arrived at a probable diagnosis, we come now to the subject of treatment. Is anything to be done for this patient, and, if so, what? It seems to me that some interference will have to be practised in the case, from the fact that the cyst is increasing in size so rapidly. But, at the same time, any operation like that for ovarian tumor is out of the question. If this growth is an hepatic cyst, it is not at all likely that it can be removed with safety to the patient. In ovarian cyst, drawing off the fluid is no longer resorted to by any one as a sanative procedure. *Paracentesis ovarii* is only of service as an aid to diagnosis and as a palliative measure for the relief of certain urgent symptoms. But here I think we might perhaps draw off the fluid with advantage. Is there no danger in such an operation? you ask. Yes, there is great danger from the escape of fluid into the peritoneal cavity, for fatal peritonitis might easily result from this cause. You know that of late years gastrotomy has been several times performed; and you have probably all heard of the celebrated case of M. Labé, of Paris, in which a silver fork was extracted from the patient's stomach by this means. Before drawing off the contents of this cyst, I should advise that an inflammatory adhesion should be effected between the parietal and visceral layers of the peritoneum, in the same manner as was done in these cases, in order to prevent the fluid from escaping into the peritoneal cavity. This might be accomplished by means of a slough of the abdominal walls caused by the application of nitric acid; or, in other words, a nitric acid issue. Through the centre of this the needle of the aspirator could be passed, and it is possible that a single evacuation of its contents might result in the cure of the cyst. If it did not, the operation could be repeated whenever it should become necessary. Of course, no internal remedies will have any effect whatever upon the growth. For me this is an exceedingly interesting case, and I trust it has proved so to you also.

CYST OF BROAD LIGAMENT; SPONTANEOUS ABSORPTION OF ITS CONTENTS.

Taken in connection with the above, the next case which I bring before you is also possessed of considerable interest. The patient's name is Mary T. She is twenty-seven years of age, and is a native of the United States. She has been married two and a half years, but has never been pregnant. She states that she has been ill for two years. About the first of December, 1876 (nearly fourteen months ago), she first presented herself at the clinic, and was carefully examined by my assistants, as well as myself. What we then found I now show you upon the blackboard. The fundus of the uterus was pushed far over to the right, and in the left of it there was a distinct tumor of considerable size. The diagnosis of either an ovarian cyst or a cyst of the left broad ligament was made, and the patient instructed to return after some little time had elapsed. Several months after that she was again examined, when it was ascertained that the tumor had not increased in the slightest degree. Ovarian disease was then excluded, and the case pronounced to be one of cyst of the broad ligament. Now, to-day, when she comes back again, it is found that there is absolutely no tumor whatever present. There is nothing extraordinary about this, however, and it only confirms the diagnosis that was determined upon. It is a possible thing for these cysts of the broad ligaments to get well, whether tapping is resorted to or not. Sometimes they are ruptured by a fall, or other sudden accident, but their bursting does not seem to cause any trouble in the peritoneal cavity. The plan of treatment formerly pursued was, to make an incision into the tumor and allow the fluid to empty itself into the peritoneal cavity. So innocuous were its contents that no septicæmia or inflammation resulted, and the wound was at once sewed up. A few years ago I had a case of large growing cyst under my care at the Roosevelt Hospital, which I supposed to be ovarian in character. By means of the aspirator I drew off a quantity of fluid from it, which did not present the ordinary appearance of ovarian fluid. But looked precisely like so much Croton water. From that time the patient went on steadily to a complete recovery. The relation of this case, as you see, is a plea for tapping, and such cysts as this cannot unfrequently be cured by this means. In one case which I knew of, however, suppuration, inflammation, and septicæmia resulted, and the patient died. But this, you must understand, was a very rare exception to the general rule. I have met with no less than three instances in which the cysts have ruptured in consequence of the ordinary manipulations resorted to in

the examination of gynæcological cases. The first of these occurred several years ago at my office. While I was making palpation, I felt it hop under my fingers, and it at once completely collapsed. The patient suffered a great deal of pain (which she described as feeling like colic), and after she had remained perfectly quiet for an hour or two, I sent her home in a carriage. Just five years afterwards I had the same accident occur in a precisely similar case; but the results were much more serious. Peritonitis set in, and during the course of the attack the temperature once ran up to the extreme point of 107 degrees. The patient finally got well, but her recovery was very tedious. One month ago a patient came to my office from Paterson, New Jersey, and while I was practising palpation in her case also, I felt the tumor collapse under my hands. She suffered such intense pain that a large quantity of morphia was required to give her ease, and I did not permit her to return home until forty-eight hours had elapsed. After that, however, she had no unfavorable symptoms whatever.

In other cases, like the present, the fluid gradually undergoes absorption, and the patient has no further trouble. Under the circumstances, I am very happy to tell this patient that she is now well—not *cured*, you understand, but well.

ANTEFLEXION FOLLOWING ABORTION.

The next case you will soon recognize as an old acquaintance (though the patient herself has never been here previously), for we have seen many like it during the course.

Mary G., a native of the United States, twenty-two years old, and married six years. She has had three children and one miscarriage, and the miscarriage occurred eight months ago. How long have you been sick? "Ever since the miscarriage." (Though I have so often had occasion to do so before, I cannot refrain from once more directing your attention to the fact that the diseases peculiar to women are exceedingly apt to date from a labor or abortion.) Of what do you complain? "Pain in the back, and a bearing-down pain." Is the pain very severe? "It is so bad that I have to have my back cupped sometimes." What else do you suffer from? "Dizziness in the head." Do you have much pain at the time of your monthly sickness? "Yes; very much indeed." (The next question is a very important one in connection with the case.) Did you suffer in the same way before you had this miscarriage of which you speak? "No, I did not suffer at all before that." Do you have the whites? "Yes, very badly."

The history thus obtained shows that this young woman was perfectly healthy up to eight months ago, when she had a miscarriage; and that she has been a confirmed invalid ever since. Among the prominent symptoms of which she complains are backache and bearing-down pains. Now, what is meant by bearing-down pains? I must confess that I do not know exactly, as it is a very common expression with women, and may mean almost anything. As a general rule, however, it is understood as conveying the idea of tenesmus or straining. The other principal symptoms are leucorrhœa and dysmenorrhœa.

The walls of the abdomen were unusually lax in this instance, and so, with two fingers of one hand in the vagina and those of the other over the abdomen, I was able to make out the size and position of the uterus with the greatest certainty. I thus found that the uterus was in a condition of marked anteflexion. Now, is this anteflexion sufficient to account for all the symptoms of the case? For me it is quite enough. But there are some for whose opinion in these matters I have the highest respect, who would say that it has nothing whatever to do with the symptoms complained of. If you asked them what, then, was the matter with the patient, they would probably say that she was suffering from general nervous derangement, or give some other such vague reply. Whatever general nervous derangement she may have, I feel sure that her symptoms will all disappear when the uterus is restored to its normal position. These gentlemen of whom I have spoken will tell you that no such results have occurred in their hands; my experience is widely different from theirs. If a patient complained to me of pain in the shoulder, and on making an examination I should find a dislocation of the humerus, I should certainly think of relieving the patient only by getting the head of the bone back into the glenoid cavity. Now this woman has luxated her uterus, and the only way to cure such patients is to restore the uterus to its normal condition. I have long held this opinion, and the more gynæcological practice that I see, the more thoroughly am I convinced that it is the correct one.

In addition to the anteflexion, I find also a laceration of the cervix, and this may possibly have more to do with the leucorrhœa than the former. On making inquiry, I find that the patient has been suffering from leucorrhœa for eighteen months, and that her last regular labor was twenty-two months ago. Although the miscarriage was only at three months, the laceration may have been produced then; it is, however, more probable that it resulted from her last labor, which she informs me was a very severe one. The leucorrhœa would seem, then, to depend in great measure on the condition of the cervix.

On reading the journals, you will be astonished to see how frequently such cases as this are treated for inflammation, without any effort whatever being made to restore the uterus to its normal position. The flexion, however, is the real cause of all the congestion and so-called inflammation, and until that can be corrected, no other treatment will be of any service. If you had a patient whose finger was enormously congested on account of the compression of a tight ring, I am sure that you would remove the ring before you attempted any other treatment; and, indeed, no other treatment would probably be necessary. Relieving the congestion of this uterus will not cure the flexion on which the obstinate dysmenorrhœa complained of depends; but curing the flexion will do away with both the congestion and dysmenorrhœa. It is like removing the constricting ring from the swollen finger. You see, therefore, that the whole matter depends, to a great extent, upon mechanical principles.

The anteflexion was, no doubt, created when the uterus was large and flabby after the miscarriage, and so easily became hurt. Women are usually willing to lie in bed for a considerable period after labor at full term; but after a miscarriage, which is, of course, only a miniature labor, they are very apt to get up almost immediately.

As to the treatment, I should recommend the ordinary methods which I have so often detailed to you, and which it is therefore unnecessary for me to repeat now. In case the leucorrhœa did not then disappear, the question would arise whether or not it were advisable to perform an operation upon the lacerated cervix.

DR. W. B. NEFTEL has been elected Corresponding Fellow of the Gynæcological Society of Boston, Mass.

RAPID DILATATION OF THE FEMALE URETHRA FOR THE RELIEF OF VESICAL IRRITABILITY.

By P. F. HARVEY, M.D.,

ASSISTANT SURGEON, U. S. A.

Mrs. L., a married laundress, aged 31 years, has been under treatment for some months for right latero-flexion, associated with chronic endometritis consequent upon subinvolution following abortion in the third month. Three months ago acute cystitis suddenly developed, characterized by alarming prostration, intense burning pain on micturition, and the passage of bloody and muco-purulent urine. The acute symptoms having subsided under treatment, the usual means of relief were tried in vain to control the chronic irritability that remained. By chemical and microscopical examination, numerous pus and epithelial cells, and some albumen were found at various times in the urine. Otherwise it was normal. Topical and constitutional measures conferred no relief whatever. Nausea and vomiting were frequent and distressing symptoms. Constipation of the most obstinate character had existed for months. The uterine trouble had been undergoing satisfactory improvement previous to the development of the cystitis, but since that occurrence the failure of the patient's strength, and the intense pain caused by the introduction of the speculum, interdicted the application of the remedies adapted to the relief of the former. Her worst symptoms seem to have proceeded from the vesical irritability. Every hour during the night a spirt of urine, amounting to a teaspoonful, would constitute her most serious trouble. Again, there would be retention with great tenesmus and suffering until the pent-up urine was voided through the catheter. The passage of a soft rubber catheter always gave severe pain.

Fully convinced of the inutility of persisting in the ordinary modes of treatment, I determined upon performing rapid dilatation of the urethra as furnishing the only hope of relief. Accordingly, on February 28th, having evacuated the bladder and brought the patient under the influence of ether, I cautiously introduced into the urethra the blades of a narrow pair of sequestrum forceps, and gently dilated the passage until it would admit my little finger. This dilatation was increased to an extent which admitted of the introduction with ease of my thumb or forefinger. Urine ran freely from the bladder during the dilatation, notwithstanding the previous catheterization. The mucous membrane of the bladder communicated to the touch a soft, velvety feel, and seemed perfectly free from disease. The cavity was normal in size. Hemorrhage was slight.

March 1st.—Passed a restless night. Suffered excruciating pain in the vesical neck after each act of micturition. Urine was passed frequently during the night without her control. Morphia failed to ease her entirely. This morning she says she feels somewhat better—makes water with less pain. Tongue dry, and covered with a brownish coat. Pulse 115. Temperature, 102° F. To have quinia and iron, with generous diet. Bromide of potassium at night.

2d.—Harassed with incessant vomiting. Pain in bowels. Pulse extremely feeble. Tongue dry. Micturition free, but accompanied with burning pain. No vesical tenesmus. Complains of abdominal pain. Ordered a blister to abdomen, to remain five hours, and be replaced with a hot poultice. Bismuth, gr. v., lactopeptine, gr. x., as required, to control vomiting.

3d.—Blister relieved her very much. Vomiting and pain returned towards evening. To have morphia and potass. brom.

5th.—Bladder a little worse; retains urine.

6th.—From this date the vesical trouble gradually augmented. Nitrate of silver topically; irrigation followed by injections of acetates of lead and morphia; suppositories—in short, the customary modes of treatment failed utterly to give the first shadow of relief. Evacuation of urine was performed every hour or two, to the amount of about a drachm each time. Finally, retention became established, and with it great tenesmus and suffering, as before.

26th.—No therapeutic resource being left which promised any useful purpose, I determined again to dilate, and this time carry the stretching to the extent practised by Teale. An anæsthetic having been administered, I dilated as before, introduced the right index-finger, crowding it gradually up, and then withdrawing, introduced the indices of both hands, stretching the urethra and vesical neck to their utmost capacity consistent with safety, with a view to completely overcome the spasm of the sphincter, and render it powerless to produce subsequent closure. Some pain was experienced after recovery from the anæsthetic, but was slight compared with that following the previous operation. Immediate relief was obtained from the more urgent symptoms, the only symptom complained of after the operation being a slight burning sensation accompanying each act of micturition. This gradually became less, and her progress has been most gratifying.

At the present date, April 14th, the vesical irritability has entirely disappeared, and she states that her bladder is all right now, and the relief she has experienced cannot be expressed in words.

I regard this case as furnishing a crucial test of the efficacy of Teale's operation for the relief of the very distressing symptoms of irritable bladder. From previous recorded experience it appears that this condition, complicating uterine versions or flexions, has undergone little or no improvement from urethral dilatation, and in the present case I confess that I regarded the operation as holding out but slight promise of cure, and had recourse to it only as a *dernier ressort*, after the complete failure of all other measures. It is possible that failure in some cases has been due to incomplete dilatation, as it was in my case after the first operation. It therefore seems proper to practise extreme dilatation before abandoning the operation as useless. The fullest distention consistent with safety appears to be reached when the channel has been enlarged to about an inch in diameter.

A New Revulsive.—M. Lardy has introduced to the notice of the profession a new revulsive, the extract of pimenta, which is noticeable for its rapid and prolonged action, and the active revulsion, without pain and itching, caused by it. In ten to thirty minutes it causes a redness of the skin, which increases for three hours and then remains stationary. The extract has a beautiful red color. It should be incorporated in an adhesive mass and applied on squares of paper, like mustard leaves. Care must be taken not to touch the eyes with the hands when they are soiled with the drug.

AN IMPROVEMENT IN THE JAWS OF THE LITHOTRITE.

By E. L. KEYES, M.D.,

NEW YORK.

Of late years all efforts in lithotrity have been in the direction of (1) shortening the operation by a closer approach of the sittings without ether (Thompson), or by (2) an improvement in the construction of the instruments used, and prolonged sittings under ether. (Bigelow.)

The latter effort seems the wiser: but it requires instruments capable of quick and safe work. Bigelow's washing instrument appears to leave nothing to desire, excepting some smaller tubes. The mechanism of the bulb is simple and effective. Not so, it seems to me, the lithotrite. The specimens of this instrument, as made by Tiemann, are clumsy and not so easy of manipulation as the English instrument. In order to avoid clogging, the male blade is made quite small as compared with the female blade, necessitating a size of the instrument disproportionately large to its working force, which of course is represented by the male blade alone.

Furthermore, I think this instrument must sometimes clog. It is made on the principle of Reliquet's lithotrite (as Bigelow states), and the latter, as furnished by the instrument-makers, clogs very badly.

The truth is, Reliquet's instrument is not made as he designed that it should be. His principle is double, involving (1) a peculiar construction of teeth in both the male and female blades, and (2) a projection of the male through the female blade and for a certain distance beyond. This latter, and by far the most important feature of the instrument, has been neglected by manufacturers.

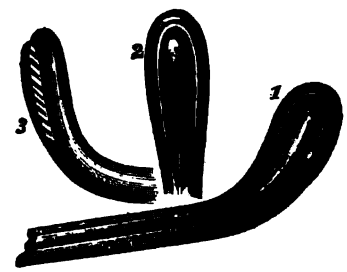
Dr. Van Buren brought home, in October, from Paris, one of Reliquet's latest instruments, as made by Collin, and warranted not to clog. I used it upon a hospital patient having a large, hard stone (mixed uric acid and urates). It clogged as I have never seen an instrument clog. It was impossible to free its jaws of detritus while in the bladder, and a serious laceration of the urethra at about three inches from the meatus was made during the extraction of the loaded blades, thus unnecessarily combining the operations of divulsion and lithotrity.

About five years ago, while crushing a uric acid stone, I found the smaller pulverizing Weiss's lithotrite to clog badly at the heel. At this point the detritus always collected, and could not be dislodged while the instrument was in the bladder, although the fragments near the beak could be easily displaced. Consequently I had a fenestra cut in the back of the female blade, at first square, then occupying the whole breadth of the instrument and extending half way from the heel to the tip of the blades. Both of these fenestræ made the instrument worse. It continued to clog, and from the open portion posteriorly upon the convexity of the female blade sharp fragments were sure to project, scratching the floor of the urethra very uncomfortably upon withdrawal, in crushing both hard and soft stones.

The instrument was therefore put aside as ruined, and was only taken out after the failure of Reliquet's instrument, above detailed, had made it evident that the clogging of an instrument might be due to the fact that the back of the male blade did not project entirely through the fenestra of the female blade. I therefore determined to apply Reliquet's principle to the instrument I had already spoiled, and consequently had the back of the female blade entirely cut away and the shaft of the male blade lengthened in the handle so that when screwed home the roughened part of the curved portion of the male blade would project beyond the female blade from heel to beak about one millimetre along the whole line.

The male blade was to be slightly withdrawn before introducing the instrument, and an occasion soon offered for testing the new principle. The test proved the instrument to be defective. It caught a small fold of the mucous membrane of the bladder, as the old-fashioned fenestrated instrument is apt to do, and proved to be unsafe—although the patient whose bladder was caught did not suffer, as to his ultimate cure, on account of the accident.

Instructed by this defect, I had the male blade of the same instrument narrowed, shortened, and slightly smoothed at its roughened edge all around. It now plays freely in the fenestra of the female blade at a distance of at least one millimetre from it above and on each side, and with the instrument thus completed I operated in conjunction with Dr. Van Buren upon a patient on March 25th, with entire satisfaction. It seemed impossible to catch the bladder: fragments were readily picked up, and although the jaws were at work crushing fragments for nearly half an hour, they came out perfectly free of any detritus, practically as clear as when they went in. The male blade was screwed well home, so that its rough edge projected through the female blade after each fragment had been cracked. The quality of the work was good, the fragments being nearly of a uniform size. Little or no dust was made. The stone was composed mainly of uric acid.



The figure represents the jaws of the instrument used, in several positions. It is simply a smaller Weiss's grinding lithotrite with the back of the female blade cut away, the curved portion of the male blade shortened and narrowed and the principle of Reliquet applied, so that the roughened part of this curved portion projects fairly beyond the back of the curved portion of the female blade.

It seems to me that the requirements of modern lithotrity call simply for an instrument to crack up the stone. There is no further need for grinding it to dust. Uniform segmentation of the fragments is far more desirable, and to effect this it is only necessary to have an instrument with one narrow blade to pass between two others. This is practically the instrument above described. All the strength required at the heel of the male blade may be obtained by increasing the antero-posterior breadth of the flattened blade at this point, and the strength of the female blade may be similarly augmented. Different sizes of the instrument would make it applicable to all sizes of stone and to all cases in which lithotrity is appropriate. This instrument is really the old-fashioned grinding lithotrite. It is difficult or impossible to catch the bladder with it if the male blade be short and narrow,

and it is in no way open to the reproach of danger which may be urged justly against the ordinary fenestrated lithotrite. Thompson appreciates this danger, and absolutely condemns all fenestrated instruments in his last public expression of opinion before the Royal Medical and Chirurgical Society, where he states that he has not used a fenestrated instrument in the bladder for ten years. The lithotrite described in this article does not possess the dangers of the old fenestrated instrument.

I may summarize what is written above as follows:

1. A typical lithotrite requires no teeth. Its function is to produce fragments, not dust, if it be proposed to wash out the detritus through a tube.

2. Such an instrument needs jaws composed of three bars, one of which must pass through and just beyond the other two—the latter precaution to insure against clogging.

3. If the male blade be smooth at its edges and so narrow and short as to play in the female blade at the distance of a millimetre or more from the latter on both sides and above, it becomes practically impossible, with the exercise of reasonable care, to catch the bladder, and the terrors of the old-fashioned fenestrated instrument, where the male fits tightly into the female blade, cease to exist.

4. The width of a blade does not add to its strength, which lies in the antero-posterior diameter of the heel. In the width of the male blade lies the danger of a fenestrated instrument.

The above statements are expressions of personal opinion, but they are deductions from clinical experience. I offer the modification I have described to the profession for trial, trusting it may give to every one the satisfaction I have derived from it.

ON THE TREATMENT OF PHTHISIS.

By C. BOTH, M.D.,

NEW YORK.

On one or two occasions, I have presented to the profession a treatment for tubercular phthisis, which, in my hands, has proved very successful. In continuing my remarks upon the subject, I desire to place upon record some additional cases. As a proper introduction to the detail of such cases, it becomes me to allude in the briefest possible terms to the methods pursued by me. I may here remark that they have already been presented to the profession, but believing that many may not be acquainted with them, I allude to them in this connection.

The method, as a whole, may be divided into three divisions; first, that referring to mechanical treatment; second, that referring to digestion and assimilation; and third, the introduction of soluble lime to invite the calcification of the tubercles. Now, in reference to mechanical treatment, I may remark that the principles upon which it rests are simply as follows: From the fact that no lung can heal until previously cleared of phlegm and pus, and accessible to air, I endeavor to bring the muscles of the throat in such a condition that they can be used as a pump to draw the air forcibly into the finest passages by suction, thus, by the repeated rushing in and out of air, they get cleared, somewhat in the manner of a rolling sea washing a rocky shore. I have advocated for this purpose three exercises, which follow each other as the strength of the patient increases, and which are described in full in The Medical Record of July 21, 1877. These manipulations have for their aim the clearing of the bronchioles and alveoles of phlegm and pus; the re-establishment of capillary circulation and respiration in the affected lung portions, and the stimulation of cellular activity generally.

My next point is the establishment of *perfect* digestion, assimilation, and excretion; it being the object to secure the quickest possible change of matter consistent with the preservation of the balance of absorption and excretion. All the points established by physiological chemistry come here into play, forming the most difficult part of the treatment, inasmuch as we have to consider the chemical transformations of certain food, not only under normal, but also under pathological conditions of glands, and of the blood itself. The diet is, therefore, a different one in each case, and varies again as the case advances. Thus, in the case of a patient whose blood is dark purple from want of proper oxidation, and for the chemically abnormal constitution of the albuminates, it would not be advisable to give him easily digestible, nitrogenous food, but we must manage to use up the old material first the best way we can, and then add, gradually, better substitutes in proportion as the effete matter becomes more oxidized and excreted. The object of diet is not to find the most nutritious or most digestible, but such food as will digest according to the quickness or slowness of the assimilating power in the individual. A specified diet, then, is required, but the individual reasons therefor can only be explained in a given case. Some of the main points in this regard have been published in The Medical Record of December 15, 1868, and of February 17, 1877.

The natural healing process of tubercles, or decaying cells in the body, is their transformation into a cretaceous mass, or calcification. We have, therefore, to furnish the blood with the salts necessary for this purpose, in such a form that they can be assimilated. These salts are, especially, the carbonates, silicates, and phosphates of lime in their organic combination with albumen, which we find in both the vegetable and the animal kingdoms. Too strong heat in cooking destroys this combination, and renders the salts insoluble, and consequently unfit for assimilation.

I finally pursue a general regimen which brings the patients under the influence of all those natural resources which are known to increase cellular activity, such as ozone, sunlight, etc. They sleep with open windows in summer and winter, and go out every day. The clearer and fresher the air the better; so important is this outdoor exercise that I insist that my patients go out in rain, snow, dampness, and even in night air and dew. I have had no instance for twenty years where a patient "caught cold" from such exposure. I only guard consumptives against strong headwinds and extreme hot weather. Hot and damp weather favors the development of tubercles; they spread quickly through self-infection from softening. The depressing influence of heat on the nervous system seems to be the direct cause of this.

If these four points are brought to bear, *properly*, upon consumptives, the result is such as may be seen in the short report of six cases, treated for advanced phthisis within the past two years. All had been under the best known therapeutical or climatical treatment with the best physicians, and they came to me apparently without any hope left for them. It will be found that I have even overreached my former percentage of 60 saved. I lost one; the prognosis of one is yet doubtful, while four are again in active business. They were treated as they came, without selection.

Case I.—Mr. W. H., a native American, of Yonkers, merchant in New York City, began treatment in October, 1876; 28 years old; had lost a brother and a

sister by consumption in 1875. Had been sick for ten years, and had to give up all business for the last two years. Regular patient of Dr. C. P. Tucker, of New York, in consultation with Drs. A. Flint and A. Clark. Had tried Minnesota and Colorado, also the outdoor-tent living, and the South, with injurious results.

Examination denoted a cavity of two inches by four inches in right apex; whole of right lung tubercular; four inches of exudation in right pleura. Left upper lobe tubercular with subcrepitant râle. Pulse 124 after rest; feverish.

Although I was unable to give him much encouragement, he nevertheless resolved to submit himself to treatment. In the course of a few months the cavity began to diminish in size, when I discovered another one below it. On the 1st of August, 1877, he resumed active business, in which he has not missed thus far a single day. In the same month he was re-examined by Dr. A. Clark, which examination proved a very satisfactory one for him. His condition is now: Left lung calcified; expiration denotes former tuberculosis. Exudation in right pleura is gone. Upper cavity about the size of a hen's egg, which probably will remain so for life. Lower cavity also diminished in size. Respiration has been established around both cavities. Pulse in bed 68—varying, 20, higher in daytime. Patient appears strong, active, and, at present, is travelling in business.

Case II.—Mr. Herm. B., a native of Hamburg, merchant in New York; 24 years old; lost a brother by consumption in Madeira, in 1875. Soon after, on an extended pleasure trip through Colorado, California, and Mexico, he was attacked several times in succession by hæmoptysis; was treated by Dr. Pregitzer, of Staten Island, in consultation with Dr. Schnetter, of New York, who sent him to Aiken, S. C. Returned from Aiken much reduced, when Dr. Schnetter advised him to live in winter at Pau, France, and in summer at Davos, Switzerland. With his steamer ticket in his pocket, he consulted me in October, 1876, being informed by his physicians that he would not live till February next, if he ventured to remain in New York.

Examination denoted tubercular induration in both apices—left side down to fifth rib, right to third. Pulse 135 after rest. Nervous system very irritable and weak. Had all the signs of acute tuberculosis, threw up his food, etc.

After a few days' treatment his pulse sank to 112, then to 104, where it remained steady for three months. During this time a cavity was detected between second and third ribs on left side, of the size of a pigeon's egg. I had promised him to be able to visit Germany in June, to relieve his anxious parents. He left New York on the 24th of May, travelled through Germany and Switzerland, and returned to New York in October, 1877. Since then, he has been steadily in active business. His condition is as follows: Right lung perfectly healed and calcified. The cavity in left lung is likewise healed; the apex above the clavicle in left side is not yet cleared, which compels him to cough and expectorate in the morning. In November, 1877, I walked with him from 51 New Street to Twenty-seventh Street and Seventh Avenue, in forty-five minutes, and he was chatting all the way without cough or fatigue. His pulse is now 60 in bed, and 80 in daytime. Dr. Lellmann, of New York, examined this case before and after the voyage to Europe; I also presented him once to Dr. L. A. Sayre, of New York. It is probable that he will be completely cured before next summer. I must state that when I first saw him he was unable to walk ten blocks.

Case III.—Mr. Geo. G., a native American, of Yonkers, member of Stock Exchange in New York, began treatment on Jan. 3, 1877. Had lost a sister in 1876 by consumption. Had been a patient of Dr. Markoe, of New York. Had taken cod-liver oil and whiskey with hypophosphites and quinine. Unable to digest any food; much reduced. Examination denoted tubercular induration in right apex to third, and in left apex to fourth rib. No cavity; no pleuritic effusion; no acute signs. Pulse only 86.

From the moderate affection of his lungs, I expected a favorable result. After having, with some difficulty, regulated his digestion, the case promised well; but I soon noticed that he did not gain in strength, in spite of good appetite and perfect digestion; and his pulse began to rise gradually. With a view of recovering his failing nervous power, I arrested all mechanical treatment. But his pulse rose steadily, and his power failed in proportion. Without any further symptom of note, he died while asleep, after having smoked a cigar and partaken of some lemonade. Post-mortem was not permitted. All the patients I have lost died in a similar way; possibly from pulmonary thrombosis, but I am inclined to think, from nervous exhaustion in spite of seemingly perfect digestion and assimilation.

Case IV.—Frank W. T., M.D., practising physician, of New York, consulted me in March, 1877, about his chest and throat. Had very marked aphonia for two years, and been under treatment of Drs. Elsberg and Lincoln for it. Had also been examined by Drs. A. Flint, A. Clark, A. Loomis, Loaming, and other physicians. Had been taking cod-liver oil, whiskey, quinine and morphia, etc.

Examination denoted tubercular induration in both apices to about the third rib. An exudation of about two inches in right pleura, over which the lung appeared in a softened condition, probably the result of a not fully reabsorbed pneumonia. Had been subject to hæmoptysis for many years, and had had pleuro-pneumonia in 1872. Pulse high and feverish, varying between 100–120. He told me that he had two tubercular ulcers upon the vocal ligaments. I did not examine his throat.

He wished to try the method, the immediate consequence of which was the recovery of his voice, which he has not lost since. Soon after, failing to make his appearance, I found him in his office, very sick and discouraged. He had taken nitrous-oxide gas and morphia, which completely upset him. I managed to get him "straight" again in a few days. He, being a physician, was rather a careless patient, attending midwifery cases at night, and neglecting at the same time his diet. Being absent from New York during the summer, I did not see him again until September. He had lost flesh and strength and had a high and feverish pulse. I then informed him that unless he put himself on a very strict diet he could not recover. This done, he has steadily improved. Had Dr. T. been a more regular patient, he ought to have been entirely well by this time. As it is, he has experienced the great importance of a specific diet, without which nothing can be accomplished in any case whatsoever.

Case V.—Mr. John M., architect, German-American, twenty-two years old, was sent to me by Dr. John L. Campbell, of New York. Patient stated that he had difficulty in his lungs when fourteen years old, from which he apparently recovered. He suffered much from three fistulæ in ano, for which he was treated by Dr. James L. Little. Schneiderian membrane affected with catarrh. He was deaf, both tympani having been destroyed by tubercular ulceration. His tongue ex-

hibited small ulcers and cracks between the papillæ. He had been in Florida, with injurious results.

Examination denoted a heavy tubercular induration in left upper lobe, comprising the whole lobus. Between third and fourth ribs there was a cavity. Lower lobe also affected. Chronic pneumonic patches and bronchitis. Wore a plaster on his left side, prescribed for pleuritis. Right upper lobe tubercular; lower lobes and pleura free. Pulse 112 after rest.

The case being a desperate one, I took him only upon request of Dr. Campbell. As the patient could not walk about, on account of his fistulas, Dr. Little put strings through them, by my request. After the second visit, Dr. Little sent me a note as follows: "Dear Doctor: Patient's fistula is ever so much better, I put a string through the other one. The patient looks very much improved. I congratulate you. Yours truly, Little." The case, undertaken the last of September, progressed well until December 10th, when the left pleuritic affection proved to be an abscess, which finally opened into the lung. This unwelcome circumstance upset the patient a good deal; his pulse, which was down to 88, is now again 112. His appetite and digestion are, however, excellent, and I have the hope yet to get him through. He walks nearly three miles per day; goes out at night, and, considering his circumstances, appears very lively. This is one of the most complicated cases I ever saw.

Case VI.—Mr. H., native American, of Brooklyn, thirty-two years old, a merchant in New York, was sent to me by Dr. George R. Fowler, of Brooklyn. Had been examined twice by Dr. A. Flint, who found the disease progressing unfavorably. Had been in Florida without benefit.

Examination denoted tuberculosis in right apex down to fifth rib; in left lung to fourth rib. I could not detect any cavity, which patient thought he had. On one place in left lower lobe an indication of formerly existing lobular pneumonia. Pleuræ free. Heart was subject to mitral disease, in consequence of rheumatism. The very dark color of his blood, contrasted strangely with his very pale lips and skin. Nails nearly black. Pulse only 88.

The case being one of uncomplicated tuberculosis, my prognosis was a favorable one. The patient, under treatment since October, 1877, has progressed exactly as expected, and I hope to dismiss him as cured next fall. I let him attend to his business all the time, which somewhat retards the case, but I am hopeful of complete success in spite of it. His blood is now in an absolutely normal condition.

It seems to me that these cases would demonstrate not only the possibility, but almost the certainty, of an arrest of phthisis in all stages, with as much assurance of success as we claim in capital surgery. To arrest tubercular induration in its beginning is, in fact, an easy matter, and can be accomplished in a comparatively short period. This treatment is the first successful practical application of the cellular theory.

Reviews and Notices of Books.

The Morphology of the Skull. By W. K. Parker, F.R.S., and G. T. Bettany, M.A. Macmillan & Co. 1877. Pp. vii., 368.

The present work by Prof. Parker is an elaborate account of the development of all, even the most minute, portions of the cranium, its annexes, and its contents in the principal types of the vertebrates, and brings a formidable array of facts to bear upon the questions of homologies and evolution. Of the 368 pages composing the body of the book, 285 are given up to the development of the skulls of different kinds of fishes, the axolotl, snake, bird, and pig; 13 to preliminary embryology, or the processes by which the vertebrated animal is evolved from its germ; 5 to the human skull; and 60 to a summary of the facts and a study of their bearings. The chapter on preliminary embryology is the one of most value to the physician, because it gives a succinct, but very clear description of the manner in which the complex organs of the body are formed out of the three blastodermic layers, and indicates the origin of many congenital deformities. The chapters on the skulls of fishes, reptiles, and birds are of interest only to the comparative anatomist, and even the final chapter, to which all the others are preliminary, is interesting to, and can be fully comprehended by, only a limited circle of readers.

Ever since the poet-philosopher of Germany, ninety-two years ago, thought he recognized in the weather-beaten skull of a sheep picked up on the beach of the Venetian lagoon the outlines of three vertebræ, the question of the homologies of the cranium thus raised has been discussed with varying fervor, and, it must be confessed, without any very definite results. Oken, who conceived the idea twenty years later and under circumstances strikingly like those which suggested it originally to Goethe, pointed out three vertebræ and the rudiments of a fourth; and now, while there is much diversity of opinion concerning the particular homologies, most naturalists are in accord upon the general ones

Prof. Parker dissents entirely from this view. He admits that in the adult mammal skull three segments can be distinguished, but he denies that these segments represent three cranial vertebræ. In the lower forms, where the resemblance should be greater if the homology were real, we find it is in fact less; thus, for example, in the skulls of fishes and amphibians, only one segment, the occipital, can be seen. The still earlier types of cartilaginous skulls (chondrocrania) and the more recently acquired knowledge of the facts of embryology are, according to our author, entirely opposed to such a theory. Each vertebral centrum is due to chondrification of a tube of tissue around the notochord, but the notochord and its enveloping cartilage are never found in the anterior part of the cranium, and consequently there can be no resemblance between the prepituitary structures at least and the vertebral centra. There are even reasons for thinking that the basioccipital, the segment in which the homology is claimed to be the plainest, itself represents ossification in several primitive body-segments.

Finally, the attempts which have been made to harmonize the theory with the points of emergence of the cranial nerves have not succeeded, for we are unable to determine the relative morphological values of the different nerves, or their relations to the nerves of other segments, and consequently all attempts to deduce therefrom the outlines of cranial segments and establish their relationship with the spinal vertebræ are, to say the least, premature.

Of the mass of facts contained in the body of the work no criticism will be attempted. The author is himself the highest authority upon the subject, and we can deal only with the arrangement. This is excellent; each stage, each chapter is summarized, and a carefully compiled index makes it easy to follow the history of individual bones and tracts comparatively.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, May 18, 1878.

THE NATIONAL HEALTH BUREAU.

THE passage of the bill creating a National Quarantine, with a central bureau, confers upon this country a benefit which it is impossible at present to calculate. The law is so comprehensive in its scope, so simple in its action, and so capable of a reasonable and intelligent system, that its real utility can only be determined by an elaboration of details, and by the adoption of measures which experience may suggest or circumstances demand. It is gratifying to know that the Surgeon-General of the Marine Hospital Service fully appreciates the duties of his new office, and that he has so promptly taken the necessary measures to carry out the provisions of the Act. Circular letters have been addressed to the consular officers and other representatives of the United States abroad, who are directed to report by cable telegram to the Central Bureau at Washington, whenever any vessel shall leave any infected foreign port bound for any port in the United States.

These consular officers for the United States are requested to put themselves into communication with the health authorities of their respective stations, and from the information obtained from such authorities, or from other reliable sources where no regularly constituted health authorities exist, to prepare and transmit by the mails, to the Surgeon-General of the United States Marine Hospital Service at Washington, weekly reports of the appearance, progress, or termination of cholera, yellow fever, small-pox, or typhus, occurring in their respective localities, and also to include in said reports information in relation to the prevalence of other preventible diseases, as diphtheria, enteric and scarlet fevers, etc., the prevailing disease or diseases in port, if any, and, when practicable, the annual death-rate per one thousand of the population, as shown by the official record of deaths for the week reported. It is further requested that special interest be taken in the healthfulness of vessels, reporting those arriving from or departing to the United States in a bad sanitary condition; also, reporting the facts of any serious sickness or unhealthiness of seamen in port, or of crews arriving from or departing to the United States.

It is intended that these weekly abstracts shall be a practical aid to State and municipal health boards, as well as to the port health authorities. To this end these reports will be sent weekly to every legally constituted or appointed health authority throughout the United States. Even at this early period it is not difficult to see the outlining of a system which prospects the establishment of a health board in every State, and the elaboration of a plan which in its sphere is likely to be as extensive and efficient as the Signal Service, or any similar bureau. From the present outlook the success of the measure seems almost a foregone conclusion.

THE FLOWER AND FRUIT MISSION.

THIS admirable charity resumed operations for the season on the first Monday of May, and hereafter the distributions will be made regularly every Monday and Thursday to the various hospitals, asylums, prisons, and other public institutions, and also to the sick and destitute in the tenement-houses of this city. The ladies having the work in charge anticipated receiving but a comparatively small supply of flowers on the first day; but, instead of this, there was a sufficient number sent in to make more than four thousand bouquets. Of these four hundred, composed exclusively of lilacs, were sent to the blind asylum, as the blind seemed to be more fond of the odor of lilac than of almost any other shrub or flower.

The Flower and Fruit Mission accomplishes its work at probably a less cost than any charitable society that ever existed in New York; for during the eight years of its existence its actual expenses have amounted to only one hundred and twenty-five dollars, which is certainly a very remarkable showing. The flowers and fruit are all donated by the friends of the charity; the railroads, as a rule, furnish free transportation for those sent from the country, and the ladies who distribute them pay their own expenses to and from the institutions visited by them. These kind-hearted ladies make no parade of their doings, and no names are ever made public in connection with the good work, except that of the secretary, Miss Russell, to whose care it is necessary that donations of flowers, fruit, or money should be sent. At the recent anniversary meeting of the society, the Rev. Dr. Hall remarked that the ladies were so quiet and so devoted in their efforts to alleviate suffering and sorrow, that they could only be compared to ministering angels; upon which Dr. Bellows very happily suggested, that although they were so very quiet, yet occasionally we might hear the Russell of their wings.

THE HEALTH BOARD AND THE NUISANCES.

From present appearances the duties of the Health Board regarding the abatement of nuisances is likely to be pretty thoroughly canvassed. It is just as well that there should be, on the part of the public, some distinct understanding as to how far the Board is really responsible for the charges which have been recently made against it. At first sight, it is very easy, while submitting to an acknowledged nuisance, to look only upon that side of the argument which is in favor of a speedy and unconditional abatement. Hence, the foul odors from Hunter's Point, from one or two soap-factories, from the manure-heaps, etc., are naturally associated with a dereliction of duty which calls loudly for rebuke. Especially is this the case at present, when a formal charge has been made to the Grand Jury by the Recorder, and that body has been directly invited to give legal form to charges of neglect of duty. There can be no doubt that public attention is now thoroughly aroused upon the subject, and that some good will come of the discussion.

Without desiring to prejudge the case, we believe that the Health Board has acted in perfect good faith in regard to all matters affecting the public health or comfort over which it has had any direct control. It is true nuisances still exist, that there are still influences at work which have a direct and indirect tendency in affecting the public health; but the question which will doubtless be decided will be, whether these have been reduced to a minimum consistent with the public safety and comfort on the one hand, and public policy on the other.

Notwithstanding the great temptation, under the spur of the present excitement, to adopt stringent measures, it is fair, in view of the good work which it has accomplished, within the past two years especially, that the Board, should be given the best of opportunities to defend its course. With such as may know the material of which the Board is composed there is scarcely room for doubt that the desire is to fulfil its utmost obligations to the public. Whether or no the latter has been done will be decided very shortly.

Possibly the best promise for the future will be an adverse verdict, a censure of the Board, and a demand for more stringency in the enforcement of the code. Then it is possible that the way may be opened for that moral support of the people which is always so necessary when radical measures are balanced against mere matters of expediency.

Heretofore there has been an obvious necessity for steering between two extremes, mitigating an evil rather than attempting to abolish it altogether. Thus far results have been obtained which, in a general way, show the wisdom of such a course. The rendering establishments are now managed with a care in avoiding noxious emanations which was never known before. The proprietors, at great expense in machinery, have reduced the process almost to a science and are anxious to co-operate with the Board. The slaughter-houses have been improved, and the time is almost ripe for that concentration of effort which will make the abattoir system an established fact, and as acknowledged a success as that in Paris or in Boston. All that seems to be required now is that preparation of the public mind which shall prove the proposed changes to be a necessity. The latter can the more effectually be done the more the subject is agitated.

It would seem almost like apologizing for the general conduct of the Board to say anything in extenuation of its action concerning the Hunter's Point nuisance; but the facts deserve to be stated, especially at a time when there would appear to be no excuse for a continuance of the dreadful odors. It is well known that the largest of these establishments at the Point was broken up by the Board last fall, and that it was at the time believed to be all that was needed. The stench, nevertheless, continued. This was believed to be due to the removal of the material then on hand. When, however, the latter was accomplished, it was ascertained that other factories farther up Newtown Creek were equally obnoxious. Then it was that the proprietors of the latter were, on behalf of the city, duly indicted, the trial being now in progress. It is much to be regretted that there is no provision of the State law which gives the Board any representation in the Brooklyn courts, and the only way that the offending parties can be reached is through the District Attorney, on behalf of the city, the Board itself merely furnishing the testimony for the prosecution. During the past winter the most strenuous efforts were made to secure the passage of a law for the purpose of escaping the present circumlocution, but without success.

In conclusion, we repeat that whatever may be said in favor of the motives of the Board, there is no doubt that many changes for the better can and should be made. But the question of vital interest, as previously intimated, in connection with this fact is, how radical can these improvements be, consistent with public policy and with a desire to popularize sanitary measures. But we shall learn more as the case proceeds.

Dr. Horace T. Hanks of this city has been appointed lecturer on Obstetrics in the Medical Department of Dartmouth College.

State Medical Society of Arkansas held its Third Annual Session at Forth Smith, commencing May 1. The attendance was good and there were many papers of merit read and discussed. The advertising physicians from Hot Springs were, on report of the judicial council, duly expelled from membership. The following officers were elected for the ensuing year: *President*—A. A. Horner, of Phillips County. *Vice-Presidents*—T. W. Hurley, of Benton County; W. H. Hawkins of Little River County; J. S. Shibbley, of Logan County; Isaac Folsom, of Lonoke County. *Secretary*—R. G. Jennings. Next place of meeting, Little Rock, the first Wednesday in May, 1879.

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, March 27, 1878.

DR. J. C. PETERS, PRESIDENT, IN THE CHAIR.

DR. H. N. HEINEMAN presented a specimen of

VALVULAR DISEASE AND ANEURISM OF LEFT VENTRICLE,

removed from Sophie Zimmerman, æt. 33, single, Switzerland, domestic. Patient was first admitted to Roosevelt Hospital in 1874, readmitted in 1876, to Bellevue Hospital in 1877, and died at Trinity Infirmary, March 14, 1878. She was perfectly well up to 1874, when, after taking cold, she was confined to bed for several weeks, suffering from sharp, stitchy pains, and from oppression in the præcordial region, from cardiac palpitation, dyspnœa, and vertigo. This attack was followed by a recurrence at intervals of all the above symptoms. She suffered constantly, until the date of her death, from a feeling of soreness and oppression in the chest, and from slight cough, with more or less whitish expectoration.

In 1876 she had an attack of subacute pleurisy of the right chest, and had some ascites, both of which disappeared at the end of a month. In 1877 she had an attack of perihepatitis. Physical examination in 1874 showed her radial pulse regular, but stronger on left than on right side. A loud systolic murmur at base and apex of heart. In 1876, Drs. Delafield and Wm. H. Draper pronounced the condition of heart as follows: Heart enlarged; diffuse impulse; apex-beat prolonged at sixth intercostal space and one inch to left of nipple line. A slight aortic direct, a well-marked mitral direct, and short mitral diastolic murmurs. A "saw" murmur. Loudest murmur at apex and transmitted to the left. Heart dilated and hypertrophied.

In 1877 patient had three loud murmurs—a mitral direct and two aortic. In 1878, Dr. C. E. Hackley recognized the signs of jugular pulsation and pulsation of the liver and diagnosed tricuspid, insufficiency in addition. Patient died anasarcous.

The autopsy was made March 15th, by Dr. Hackley and myself. Heart.—Pericardium thickened and everywhere firmly adherent to heart-walls. Right ventricle and auricle dilated; left ventricle dilated and hypertrophied; mitral and tricuspid orifices dilated, valves insufficient and atheromatous; aortic valves atheromatous and insufficient; pulmonary orifice insufficient from complete obliteration of one valvular leaf, which was adherent to the wall of the artery.

The upper two-thirds of the left ventricular wall, commencing at its base, was distended into a single saccular aneurism, with thin walls lined by a layer of lime salts, and within this by successive layers of coagulated fibrin old and recent, but which had not yet organized. Aneurism was about 4½ inches in diameter and opened by an orifice of 1½ inches diameter into the left cavity. In addition there was fluid in the cavities of the body, the liver was large and cirrhotic. The lungs in condition of pigment-induration, and spleen large and congested. The remaining viscera were normal.

DR. PETERS remarked that there were eight cases of cardiac aneurism in the records of the Society, the majority of them, as is this case, being connected with the left ventricle.

TUMOR OF INTESTINE; LUMBO-COLOTOMY.

DR. E. MASON presented the rectum and portion of the ascending colon taken from a patient upon whom had been performed the operation for lumbo-colotomy, eighteen months ago. The patient was a female aged twenty-five years. In July, 1876, she was delivered, by the forceps, of a dead child, after a prolonged labor. Four months afterwards a recto-vaginal fistula made its appearance, from which the greater portion of the fæces escaped. Soon after she began to suffer from great pain in the rectum with bearing-down. A stricture was diagnosed and was operated on four times, twice by divulsion and twice by incision, but without any permanent good effect. She entered Bellevue Hospital during September, 1876. At that time a tight stricture with ulceration was discovered, two inches above the rectum, and at the site of the stricture there was felt a distinct mass, which was regarded by the majority of surgeons who examined her as cancerous in origin. It was, however, most probably chancroidal, although she denied ever having had venereal disease. As a result of a consultation, lumbo-colotomy was performed September 20, 1876. Immediately after the operation the patient was relieved of the intense pain from which she had previously suffered, and continued quite comfortable. The stricture gave way gradually, as usual in such cases, but still the ulcerations existed. At times the patient suffered from paroxysms of intense pain in the hepatic region, the cause for which was not ascertained during life. Besides this trouble she was also the subject of Bright's disease, from which, together with double pleurisy, she died on the 8th of last March. At the autopsy the rectum was found covered with numerous ulcerations, which extended a considerable distance into the colon. Encircling the upper portion of the rectum was an adventitious mass, the nature of which, in the absence of a microscopical examination, could not be ascertained. The cause of the hepatic pain was explained by a calculus that completely plugged up the cystic duct.

LITHOTRITY BY BIGELOW'S APPARATUS.

DR. KEYES presented the fragments of two small uric acid stones taken from a patient by lithotrity, at a single sitting under ether, the operators being Dr. Van Buren and himself.

The patient was a man of 63 years, whose prostate was normal, excepting a slight centric enlargement. There was moderate cystitis, little or no atony. The urethra was distinctly narrowed in the bulbo-membranous portion. Kidneys sound. The bladder symptoms in this case dated about one year back; no instrument had entered the urethra previously to the passage of the searcher; the patient had never had urethral fever; the urethra and vesical neck were excessively sensitive to instrumentation.

On March 25th, without previous preparation of the urethra, the patient being under ether, the stones, the size of which and their chemical composition had been already estimated, were reduced to fragments, and removed entirely from the bladder in one hour. Bigelow's bulb for washing the bladder was used, adapted to a tube from Nelaton's instrument, and the apparatus was found to functionate admirably. None of Bigelow's tubes as now made by Tiemann could be used on account of their great size. Nelaton's tube measured 13 Am. scale (30 French) and distended the urethra to its utmost. It was on ac-

count of this smallness of the washing-tube that the sitting had to be so much prolonged. The lithotrite was introduced three times. The first crushing lasted nearly half an hour, and yielded ninety-eight grains of crushed fragments to a washing of about ten minutes. The second crushing lasted about ten minutes, and yielded twenty-nine grains. The third crushing lasted two or three minutes, yielding two or three grains—a final fragment.

Bigelow's instrument and tubes for washing the bladder were shown and their action explained. The lithotrite used was a peculiar model (not Bigelow's), but a small fenestrated instrument, especially constructed so as not to clog. It worked perfectly, and at the end of the long crush (nearly half an hour) came out entirely free from detritus. (In the present number of the RECORD, Dr. Keyes gives a description of this instrument.)

The patient had a urethral chill on the third day, and complete atony followed the sitting of lithotrity, neccssitating the use of a catheter. At the date of going to press, power is returning to the bladder, and the patient has been doing perfectly well.

PLEURISY WITH EFFUSION (R.); COMPRESSED LUNG; FIBROUS PHTHISIS; DILATED BRONCHII; BRONCHIECTATIC CAVITIES.

DR. BEVERLEY ROBINSON presented a specimen of the above with the following history:

T. M., æt. 38, single, admitted to Charity Hospital, February 26, 1878; died March 6, 1878. Patient has always been healthy until two months ago, when he began to suffer from slight pain and a feeling of malaise on the right side. Shortly, a dry, hacking cough manifested itself, accompanied with dyspnœa, loss of flesh, and night-sweats. He could sleep only on the right side, and so soon as he turned towards the left was greatly oppressed. He is now much emaciated, has complete loss of appetite, and suffers from a parched mouth and continuous thirst. His tongue is brown and dry; his pulse frequent (118), his respiration shallow and somewhat labored (36). The chest is bulged on the right side, and the movements in this region are much restricted. Measurement with tape-line indicates two inches as the extent of the enlargement; there is flatness which reaches on this side (r.) to the second rib. The heart is displaced downward and to the left, the apex beating an inch to the left of the nipple (l.). Under the left clavicle the percussion sound is elevated in pitch. Over the entire right lung respiratory sounds are absent, whilst over the left one they are markedly exaggerated. Urine normal.

Feb. 26th.—Patient was aspirated, with ntab le relief to his difficulty of breathing.

Again, on Feb. 28th, aspiration of right chest was performed, and a quart of straw-colored liquid was withdrawn, with a similar result as before.

March 5th.—Temperature, 103¼° Fahr.; pulse, 120; somewhat irregular and feeble; respirations, 40 in the minute; the right chest cavity was again nearly filled with a liquid effusion; aspiration of 40 ounces was performed for the third time. After the operation the patient slept quietly during several hours; he awoke at 10 o'clock, A.M., suffering from dyspnœa, which continued with increasing intensity until 3 A.M., when he died, apparently, from undue compression of the heart and inability of sufficient respiratory function.

Autopsy was made by Dr. E. A. Maxwell, 23 hours after death, of which the following is an abstract: the right pleural cavity almost filled with opaque, yellowish fluid; place of last respiration was looked for carefully, and only a slight streak could be found marking the point where it had been performed; there was no ecchymosis locally and no signs of inflammatory action at this level. The whole pulmonary pleura was covered with pseudo-membranes of moderate thickness; costal layer thickened and roughened. On stripping pseudo-membrane from lung, the superficial lobules are distinctly mapped out by narrow yellowish white lines, which project into the pulmonary structure.

The entire lung (r.) is moderately compressed, and the lower and middle lobes are carnified. Posterior portion of upper lobe is almost wholly involved by clusters of fibrous nodules and chronic interstitial pneumonia. Remaining portions show analogous changes. Over the opposite lung (l.) firm old pleuritic adhesions are found, and in the upper lobe there are two bronchiectatic cavities. At certain points the bronchii are narrowed; at others dilated. There is some œdema in this lung, and tenacious muco-pus in bronchii. Heart, normal. Liver, spleen, and kidneys congested.

The points of interest in this case are: 1. The cause of death. 2. The absence of local signs, indicating the seat of respiration. 3. The rapidity with which the fluid effusion recurred. 4. The question as to how much fluid should be withdrawn at each aspiration in similar cases which tend towards chronicity.

PERINEAL LITHOTRITY.

DR. L. A. STIMSON presented the urinary organs of a man, 72 years old, from whom he had recently removed a stone by perineal lithotrity. The patient's first symptom of urinary trouble was an attack of retention two years ago; it was relieved by the passage of a catheter, and did not recur. This was followed by slight symptoms of cystitis and stone, and then by more and more frequent urination, which ended in complete incontinence about two months ago. Examination disclosed a soft stone about one inch in diameter, in a thickened, contracted bladder. The urine was ammoniacal, of low specific gravity, and contained considerable albumen, but no casts.

The operation was performed with the thermo-cautery, the pre-rectal incision, and the Guyon dilator. The stone was easily crushed with small forceps and promptly removed. The hemorrhage was slight. An hour after the operation, the patient had a chill; the next afternoon he was slightly uræmic, and on the third day he sank steadily and died at 5 o'clock, P.M., with a final temperature of 105°.

The points of pathological interest in the specimen are as follows: The prostate is small, with a central third lobe as large as a cherry; the prostatic urethra is uninjured; the membranous urethra is divided along its floor for one and one-fourth inches; the bulb extends down to, and is closely united with the rectum, and the incision has passed through its lower portion, cutting off a strip one-eighth of an inch thick. The bladder wall is hypertrophied, especially in the lower lateral portions, where it is more than an inch thick, and is so contracted that its cavity would not contain more than an ounce of urine. Its inner surface is rough and sacculated, of a deep slate color, and shows no signs of injury except a slight rent of the mucous membrane at the neck.

The ureters are dilated. The kidneys weigh seven and one-fourth and six ounces respectively; their capsules are adherent and thickened, the cortex diminished, the markings in great part obliterated, the pelvis slightly dilated, and its walls injected and thickened.

The bladder lay close behind the symphysis pubis, and was firmly bound down to it; the lower border of the omentum was adherent to the bladder, and the cavity of the pelvis was occupied by a mass of convolutions of the small intestine, firmly bound together and to the parietes by old adhesions.

The points of operative interest are the position of the bulb, and the close proximity of the rectum to the portion of the membranous urethra just in front of the prostate. It is probable that, if the lateral operation for lithotomy had been performed in this case in the usual manner, the rectum would have been cut into.

BUTTON REMOVED FROM TRACHEA THREE YEARS AFTER ITS LODGEMENT.

DR. BRIDGE exhibited a button removed by operation from the trachea of a woman, with the following history: She was a native of Ireland, 40 years of age, and the mother of a large family, and had been troubled for about a year with a dry and harassing cough. She was sent to Dr. Bridge by Dr. Ormiston, of Brooklyn, in order that she might have an examination of her larynx, and if necessary have an operation performed. She had consulted six or seven physicians in Brooklyn, the majority of whom stated that she had consumption, basing their opinion upon the cough rather than upon any positive physical signs. Dr. B. could not, however, discover any physical signs of such a condition. Before asking her anything concerning her history, Dr. B. made a laryngoscopic examination. The larynx and pharynx were perfectly normal; but when the patient took a full inspiration and separated the vocal cords fully, a black substance was discovered in the trachea, and lying across it in a diagonally transverse condition. Dr. B. then learned that three years previously, the patient, while on a voyage from Liverpool to New York, and while playing with her child, and at the same time holding between her lips a button, the latter escaped down her throat during an inspiration. Immediately after the accident she had a number of suffocative spasms, which were undoubtedly due to the presence of the button in the trachea, but which ceased within an hour or two. The surgeon of the ship said that the button must have gone into the stomach, which opinion was endorsed by some of the medical gentlemen who afterwards saw her in Brooklyn. A year after the accident the patient was seized with a dry cough, which was attended with some wheezing in breathing. On discovering the foreign body in the trachea, Dr. Bridge at once decided to operate, and the patient was accordingly admitted into the Trinity Infirmary. The button lay in such a position that it might have been readily seized with a forceps, but as there was great danger of its being tilted during the struggles of the patient, and plugging up the trachea, demanding tracheotomy under very disagreeable circumstances, the safer course was taken of administering ether. The button was then easily removed. The patient left the Infirmary perfectly well ten days afterwards.

DR. SATTERTHWAITE presented a specimen for a candidate, after which the Society went into executive, session.

MEDICAL SOCIETY OF STATE OF PENNSYLVANIA.—The Twenty-ninth Annual Session of this Society will be held in Pittsburg on Wednesday, Thursday, and Friday, May 29, 30, 31, 1878, commencing on Wednesday, at 3 P.M.

NEW YORK ACADEMY OF MEDICINE.

OBSTETRIC SECTION.

Stated Meeting, April 15, 1878.

DR. SALVATORE CARO, CHAIRMAN.

TREATMENT OF DIPHTHERIA.

DR. O'SULLIVAN, in speaking of the treatment of diphtheria, remarked that he had found *steam* to be a most valuable remedy. He was of the opinion that the hot air from furnaces was in a great measure irritant to the air-passages, and that it should be mollified by the vapor of water. He urged the necessity of rigid quarantine, and thought that those attending upon the patients in the capacity of nurses should not be permitted to go out among the people—for example, gather with the crowds which attend mass in the Catholic churches—because there was danger of communicating the disease in that manner. He did not approve of the use of quinine except in tonic doses in the latter part of the disease, and then it should be combined with stimulants.

DR. J. LEWIS SMITH remarked that he was not aware that quinine exercised any curative influence over diphtheria except as a tonic, and in that capacity he did not object to its use. The quite intense fever which was usually present at the onset of the disease commonly subsided without the adoption of active measures for its control. At least, he was rather inclined to the opinion that the fever would abate without the use of large doses of quinine. He then related a case to which he was called in consultation, and where he found that the child had received forty grains of quinine daily. The child succumbed on the third or fourth day of the disease.

DR. J. C. PETERS said that he never gave quinine in the treatment of diphtheria, except late in the case, when the patient needed tonics. Brief reference was then made to a case of convulsions occurring in a child, and to whom quinine was administered in five-grain doses every four hours at first, then every six and eight hours, and finally it was reduced to a single dose on each Friday, as the original convulsion occurred on a Saturday. Some 250 grains of quinine had been given without producing a shadow of unpleasant symptoms. It was combined with syrup of coffee when administered by the mouth; it was also given in suppositories.

UTERINE HEMORRHAGE FROM NERVOUS SHOCK.

DR. O'SULLIVAN referred to a case in which labor was completed without accident or complication, and the woman was in excellent condition until the *fourth* day, when a draught of cold air struck her. She immediately felt a slight chill, and with the chill came a gush of blood from the vagina. The principle in the treatment was to give rest and avoid internal medication, such, for instance, as the use of ergot, etc., etc. The patient accordingly was kept perfectly quiet, and a Dover's powder was given. A slight hemorrhage occurred on the following day, and a still slighter one on the next day; but from that time the woman went on and made a complete recovery.

THE USE OF ERGOT AT THE TERMINATION AND SUBSEQUENT TO LABOR.

DR. SELL, in connection with Dr. O'Sullivan's case, remarked that he invariably gave ergot just as the child was being delivered, and continued it in gradu-

ally diminishing doses up to the seventh or eighth day subsequent to labor. He did so in accordance with the teaching he had received at the Lying-in Hospital in Vienna. The guide in that institution was that ergot should be continued while the fundus of the uterus could be felt above the brim of the pelvis. Dr. Sell regarded this as an important item in the treatment of the puerperal case, and adopted it for the purpose of preventing subinvolution of the uterus. He had not seen any ill effects follow the use of the drug.

Dr. Caro thought it was unnecessary to administer ergot with the view of producing uterine contraction, when the uterus contracted firmly of its own accord, and he believed if Dr. Sell was aware of the effect the ergot was liable to produce upon the intestines, producing paralysis of the muscular coat and developing tympanitis, that he would discontinue its use. Perhaps the ergot might bring on spasmodic uterine contraction, but it would probably, at the same time, produce other and unfavorable results. If the placenta was removed and the uterus was well contracted, he regarded the use of ergot as unnecessary.

Dr. Sell remarked that he had never seen a case in which tympanites had followed the use of ergot, such as referred to by Dr. Caro, and was firmly of the opinion that the effect produced by the drug was beneficial rather than otherwise.

Dr. Hubbard said that he had not been able to see the propriety of administering a dose of ergot at the conclusion of a natural labor. Nor had he been in the habit of giving ergot if the uterus contracted firmly, with the view of reducing the size of the organ and keeping it reduced.

Dr. Hall remarked that he did not, in cases of natural labor, use ergot subsequent to the delivery of the child, unless there was some special indication that hemorrhage might possibly occur after he had left the house.

Dr. J. C. Peters remarked that he used ergot shortly before the completion of labor or immediately afterwards, in three classes of cases.

First.—In those cases in which the woman at previous confinements had had undue hemorrhage;

Second.—In those cases in which the woman had suffered from severe after-pains in connection with previous labors; and

Third.—In those cases in which there has been subinvolution prior to the pregnancy.

In an ordinary labor without accident or complication, and occurring in a primipara, he had not been in the habit of using the drug.

ADHERENT PLACENTA—REMOVAL OF PLACENTA AFTER LABOR AT FULL TERM.

Dr. Crampton referred to a case of adherent placenta occurring with the *fifth* pregnancy. The previous confinements had been entirely natural. The child had evidently been dead for some time previous to labor.

The placenta not coming away readily, the doctor introduced his hand into the cavity of the uterus, found the placenta firmly adherent over its entire extent, and with considerable difficulty removed it, the removal being accompained with considerable hemorrhage. The woman was doing well.

Dr. Crampton remarked that it was his custom, if the placenta was not quickly delivered, to at once remove it by the introduction of the hand, if need be, into the uterus, as he was not able to see that anything was to be gained by waiting.

Dr. Hubbard did not approve of the removal of the placenta at once if there was a little delay in its delivery in cases of natural labor. If the process of labor was physiological, why interfere? If the placenta was adherent, and did not come away in due time, then we should proceed to deliver. He had waited *two* hours, sitting by the bedside, giving the uterus support by the hand and kneading the abdomen gently, and then seen the placenta delivered in the most natural manner. He believed that it was better to be guided by the processes of nature than to at once interfere. Twenty or thirty minutes was none too long to wait.

Dr. O'Sullivan believed in giving nature a fair opportunity to effect the delivery of the placenta.

Dr. J. C. Peters did not believe in meddlesome midwifery, but he had always made it a rule to deliver the placenta promptly. He insisted upon having firm support given to the abdominal walls and uterine tumor as soon as the child's head was born, and in nine out of ten cases he found the placenta lying in the upper part of the vagina, from whence it could be immediately removed without incurring any risk. He did not wait for the development of a pain, but pain was usually excited as soon as the manipulation was commenced.

Dr. Hubbard was inclined to wait for the development of a pain before interfering with reference to removal of the placenta.

Dr. Caro said that, in remarks made upon a previous occasion, he had been misunderstood by some of his medical brethren with reference to the management of the placenta. He had been understood as advocating the immediate removal of the placenta in *all* cases. That impression he wished to correct. His practice was the following: *In cases of miscarriage*, if the placenta was not at once delivered, and there was no hemorrhage, no fetid discharge, no chill, no unfavorable symptom, the woman was comfortable, he allowed it to remain until the os dilated, etc., and nature made an effort at expulsion, or some symptom developed which rendered its removal necessary. His experience had been that such placentæ were usually spontaneously removed within four or five days.

In cases of labor at full term, he followed Dr. Peters' plan almost exactly during delivery of the child, waited twenty-five or thirty minutes, and if the placenta was not then delivered spontaneously, he at once removed it by manual interference.

FOLLICULAR TONSILLITIS AND HERPETIC SORE-THROAT —CHLORATE OF POTASH AND RENAL DISEASE.

Dr. J. C. Peters remarked that at the last meeting of the Section the question was raised: was there any connection between follicular tonsillitis and herpetic sore-throat? He then referred to a case of follicular tonsillitis, in which there was also a quite large patch of exudation upon the uvula. Whether there was any diphtheria in the case he was unable to say positively, but thought there was not.

The patient, an adult, was directed to take large pinches of chlorate of potash crystals upon the tongue, at first every hour, on the second day every two hours, and at the end of forty-eight hours every appearance of the throat-trouble was wiped out, but there had appeared a distinct herpetic eruption upon the lips. He had treated a large number of cases of follicular tonsillitis in the same manner, and uniformly with good results.

He had not seen any ill-effects following the use of the chlorate of potash, especially in the way of renal trouble.

Dr. J. Lewis Smith referred to a case in which a

child three or four years old had taken ʒ iij. of the chlorate of potash within twenty-four hours. When he saw the child it was unable to pass any urine, except a few drops of bloody urine, its face was livid, and death occurred within the following day. He thought that the people should be cautioned with reference to the indiscriminate use of chlorate of potash, which had become a popular domestic remedy.

Dr. Hall referred to a case in which an infant under one year of age took about ʒ i. of chlorate of potash during a single night, with fatal result. There was suppression of urine, and the face was livid. He always took occasion to caution the people against the too free use of the drug.

Dr. O'Sullivan had feared the bad effect which might be produced by the remedy.

Dr. Smith remarked that from two to four grains was the dose ordinarily used for a child.

Dr. Hall thought it should be well diluted when given.

Dr. Peters remarked that he had not seen the slightest disagreeable effects produced by the use of chlorate of potash given as he had mentioned. His doses were probably not more than five grains.

Dr. Smith remarked that in connection with disease in which there was a tendency to nephritis, as in scarlet fever, he thought it eminently proper to give caution regarding the use of chlorate of potash.

Dr. F. V. White remarked that he had been in the habit of giving chlorate of potash freely, but had never seen any disagreeable results. He also directed attention to the fact that Dr. Jacobi had reported cases in which fatal results had followed the use of large doses of chlorate of potash.

Dr. Caro related the history of a case in which the possibility of chlorate of potash poisoning was suggested.

The topic selected for discussion at the next meeting was the treatment of puerperal eclampsia subsequent to labor.

The Section then adjourned.

NEW YORK COUNTY MEDICAL SOCIETY.

Stated Meeting, April 22, 1878.

Dr. John C. Peters, President, in the Chair.

BULBAR, OR GLOSSO-LABIO LARYNGEAL PARALYSIS—IMPROVEMENT UNDER ELECTRICAL TREATMENT.

Dr. E. G. Janeway presented a case of *bulbar paralysis* in which the patient had made marked improvement under the influence of electrical treatment. There was paresis of the lips and fibrillary tremor, paresis and fibrillary tremor of the tongue, difficulty in swallowing, some difficulty in pronunciation, muscular paresis and atrophy affecting the abductor and opponens pollicis. Under treatment the improvement had been so marked, that the woman was able to pronounce the letters C, S, and L very well, and she could also give an audible whistle. There had also been an increase both in the size and power of the affected muscles.

The treatment had consisted in the use of plexus-nerve and nerve-muscle currents for the arms, and nerve-muscle current for the tongue and face; galvanization of the sympathetic (superior cervical ganglion), with the continued and occasionally with the interrupted current.

A DEMONSTRATION OF THE TREATMENT OF ANGULAR AND LATERAL CURVATURE OF THE SPINE.

Dr. Lewis A. Sayre gave a practical demonstration of the treatment of Pott's disease and lateral-rotary curvature by means of suspension of the body, and retention by the application of the plaster-of-Paris jacket.

Several patients with angular curvature of the spine were first presented. Of those, some were wearing the jacket with great comfort, while others gave evidence of having been completely cured by the plan of treatment. The object of treatment in Pott's disease was to remove pressure from the diseased vertebral surfaces and to prevent reflex muscular contraction.

Horizontal posture removed the pressure, but did not always prevent reflex muscular contraction; hence, distortion might occur, notwithstanding the beneficial effect which otherwise might arise from that plan of treatment. Confinement in the horizontal posture was also detrimental to the general health of the patient. For the purpose of maintaining the body in an erect posture and throwing the weight upon the transverse processes of the vertebræ, a great variety of mechanical apparatus had been devised. Of all the instruments which had been constructed for that purpose, Dr. C. Fayette Taylor's brace, *in its original form*, was the best. Dr. Sayre urged, as an objection to braces in general, that their removal and readjustment permitted motion to take place at the point where the disease was situated. *Continued rest* at the seat of the disease was one of the great essentials in the treatment of angular curvature of the spine; hence, it was desirable to have an apparatus which could be worn for weeks and months without removal.

One important objection to Taylor's brace was the fact that pressure made by the pads upon each side of the spinous processes obstructed the circulation at the very points at which it was necessary to furnish nutrition in the greatest abundance; hence, by its use, disintegration of the bones was favored rather than recovery.

Another objectionable feature of the brace was the part which passed over the top of the shoulders, and which had been added as an improvement upon the original instrument. The shoulder-straps were regarded as dangerous and injurious, because they *prevented* the extension necessary to remove the pressure from the bodies of the diseased vertebræ.

A great variety of instruments were exhibited and received the passing compliments of the doctor.

A plaster-of-Paris jacket was then applied to a man suffering from Pott's disease.

LATERAL-ROTARY CURVATURE OF THE SPINE.

Dr. Sayre then proceeded to make some remarks regarding the causes and the changes present in lateral-rotary curvature of the spine.

The principle of treatment was to make extension, and then retain the body in the extended position.

A variety of instruments were exhibited which had been devised for overcoming the curvature by making pressure at certain points upon the walls of the chest, and they were all rejected.

A plaster-of-Paris jacket was then applied to a young man while he held himself suspended from the chin and occiput. In conclusion, Dr. Sayre referred to the general good results which had followed the application of the plaster-of-Paris jacket in between sixteen and seventeen hundred cases, and read the opinion of Mr. Berkley Hill, regarding the great value

of the plan of treatment, as he had published it in the London *Lancet*.

Dr. Sayre was assisted by Drs. Louis H. and Charles H. H. Sayre.

Dr. Mitchell, of the Committee on the Abuse of Medical Charity, read a report, which was referred to the Comitia Minora.

The paper for the next meeting is to be read by Dr. Nichols, of the Bloomingdale Asylum.

The Society then adjourned.

Correspondence.

THE PERSONAL EXPERIENCES OF AN EX-OPIUM HABITUÉ.

[The following recital, by a physician who was the victim to the opium habit, is so interesting in its psychological bearings that it is presented in all its extravagance of expression and force of description.—Ed.]

"Out of the jaws of death! out of the mouth of hell!"

Six months during the late war I endured the horrors of a Southern prison—a comrade and acquaintance of the late A. D. Richardson, who, when he escaped, forwarded to his journal a telegram with the above quotation. But how few realize the terrible import of those words. To be thrilled by the story of human suffering, graphically told, is much; but to undergo suffering which no pen or tongue can describe; to be encompassed with woe that mocks the imagery of a Milton; to be enveloped in a darkness which even his portrayal would contrast as midnight with the light of noontide—is more; *that* is to be where *I* have been.

I, a follower of Esculapius? Yes, as the world goes. Erudite in the realm of therapeutics? I so fancied myself. Had I not read that a prolonged use of opium gives rise to grave functional disturbance? Most truly. Did I not know its baneful effects when used habitually? *A priori* I knew absolutely nothing. Yet I believe I was no more ignorant than nine-tenths of those who have not to its seductive power fallen captive.

A victim to neuroses, which came as sequelæ to my prison-life, I began their alleviation by the hypodermic use of morphia. Complicated with these was a functional cardiac trouble, of which I had noticed how magically the morphine allayed its most distressing symptoms. Day after day, week after week, was the opiate continued, and, for the first time in twelve long years, I knew what it was to enjoy pure, unalloyed happiness, unbroken by a single pain. Nor clouds, nor gloom, nor slight offending to the soul or sense—naught that savors of discordant life was mine. This harp of a thousand strings in me was well attuned, and the deft harper—the morphian god—knew his business well. I had been embraced by the most beautiful sorceress of earth. Beautiful in her magnetism, for I saw her not—I *felt* her charms. Her beauty I conjured up to be, by special imagination, more divine than he proclaimed his own to be who wore a silver veil. Time came, the veil was drawn, and then a thing she looked—so black, so damned, that not in hell another could be found as horrible and vile.

To use a style that borders on the oriental may seem out of place in a paper prepared for medical readers. This is not so; for the very effects of the mysterious drug show themselves in perturbed mental phenomena that cannot be too highly colored. The morphia victim dwells, after the first exhilaration is gone, in a realm of phantoms and shadows. I saw sights more terrible than can be imagined. I felt pains that do not belong to any mortal lesion. I have shrieked in my terror, but the shriek only awoke a myriad of devils who had been sleeping till then, unseen by me.

Four months of morphia addiction sufficed to bring me to this land of horrors, where no joy came or has come since the making of the world. My days were spent in self-indulgences. Alone in my office, in an easy-chair, I could, with poetry and interesting therapeutical works, manage quite comfortably to pass the hours away. But let a patient summon me from home, and my gloom and despondency were almost insupportable. I was tormented by a continual self-conflict. Conscious of the weakness of my efforts to emancipate myself, I kept on planning some new mode of attack in the nerveless hope that I could defeat the Lethean devil whose thews were strong as steel; and yet I knew that, as day followed day, and week followed week, in so far as all this mental warfare was concerned, it could bring me no help in my awful bondage.

No dark imagery can paint the encompassing horrors of those nights of torment which belonged to the last two months of my twelve months' morphia addiction. Not one hour that I passed in bed between midnight and noon did I know normal sleep. In dreams that seemed more vivid than reality I entered gloomy caves, and walked for hours over rotten cadavers, sometimes forced to step on them and be overwhelmed with the loathsome odors. I saw faces in the weird darkness, sometimes a thousand at once, and each was made of blood-red flame. They flashed and went out. My nightmared brain was chased and haunted by everything that can exist in a vast hell of phantoms.

But a waking reality, and one that made my heart knock at my ribs was, that through my mind oft came the thought: "How sharp and polished you know your bistouries are! How easily they would sever the coats of the carotids! Not your own only, but your children's also!" Then the exclamation, "O God! *this is madness!*"

I know only too well that that accursed road would have ended in homicide and self-destruction.

Physically, the morphia's destructive force with me was rapid. The torpor of the intestinal tract was absolute, and no movement obtainable but by calling to my aid a Davidson's syringe and scoop besides. Even with all these accessories I suffered pains that racked me to the core.

I do not propose to go into the pathology or etiology of opium addiction, but I proclaim it as my sincere belief that any physician afflicted with neurotic disease of marked severity, and who has in his possession a hypodermic syringe and Magendie's solution, is bound to become, sooner or later, if he tampers at all with the potent and fascinating alleviative, an opium habitué.

The first dose is taken, and mark the transformation! This overmastering palliative creates such a confident, serene, and devil-may-care assurance, that one does not for once think of the final result. The sweetness of such harmony can never give way to monotony. Volition is suspended. You may not think of it when the pain for which it was taken subsides. But when distress supervenes, you go at once for the

only balm that abounds in Gilead, and every additional dose is but another thread, however invisible, of which the web is made that binds us fast as fate.

I come now to the history of my escape. I need not tell of my efforts at self-cure. I need hardly speak of life without a future, of being excluded from a ray of hope. I did not expect it would be my good fortune to meet with helping hands, and, by their assistance, secure for myself—limned, fettered, and enthralled—freedom like life made new. If the black javelin of remorse ever pierced a human heart, lacerating its filaments with merciless barb; if ever Death came from his murky retreat to hang on human hope and promise his solemn draperies—if these to one have ever come, they came to me!

But the day of my deliverance drew nigh, and, from the first moment after passing the portals of Parrish Hall, I had no doubt regarding the successful issue, which, with me, amounted to a passion to be rid of the fatal drug forever. Under the influence of tonics and sedatives judiciously administered, after eight days had passed, during which pain and suffering were greatly mitigated, I came forth—free. Several days following I experienced latent neuralgic pains; but such was the exhilarating sense of freedom from the heavy hand that so long had held me down, I scarcely noted neurotic twinges which would have made me writhe at any other time.

In the institution I have mentioned, all the material surroundings were as desirable as the heart could wish. Psychically, I found myself in an atmosphere where all was pleasant.

Two months are nearly gone since I took my last hypodermic. I have gained in weight twenty-five pounds; I am able to enjoy a normal quantity of sleep. But even yet the nervous system shows the strain it underwent, for I feel at times an indescribable restlessness which, however, I can overcome by pedestrian exercise. I know I shall reach par in that direction by and by.

Finally, the effect of opium on the normal nature in the first stage of emancipation is bewildering. One is like a ship which has been sunken, but afterwards raised, refitted, and sails trimmed, but as yet helmless. The will, so long paralyzed, cannot be expected to be of normal strength. But, as time is required for the nerve-worn system to become tranquil and placid, so also will come strength in resolve, and, to worthy purposes, a volition equal to the task.

I am back among my patients, feeling now that I have a mission in life. Had I the power, I would destroy the last grain of the dread narcotic. It did not work its worst on me, but to him on whom it does, pity from the Everlasting would seem feeble.

What ruin it has wrought in me will be made right again. I have one song—

> "Time, the avenger! unto thee I lift
> My eyes, and hands, and heart!"

M. D.

Royal Victoria Dispensary (Northampton, Eng.).—The revenue for the year 1876–1877 was £3,698, the actual receipts being £2,356. The amount paid to the three medical officers was £1,805, who attended to 54,908 cases, as follows: 32,014 at the patients' own houses, 16,233 at the houses of the medical officers, and 6,661 at the dispensary. The cost of drugs was £316. The balance in the treasurer's hands at the end of the year (1877) was £1,261. This is the thirty-third annual report, and appears to show the institution to be in a highly satisfactory condition.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from May 5 to May 10, 1878.

Clements, B. A., Major and Surgeon. Granted leave of absence for one month on Surgeon's certificate of disability. S. O. 37, Dept. of the Platte, May 1, 1878.

Woodhull, A. A., Major and Surgeon. Relieved from duty at Angel Island, Cal., and assigned to duty at Point San Jose, Cal. S. O. 69, Div. of the Pacific and Dept. of California, May 2, 1878.

Caldwell, D. G., Capt. and Asst. Surgeon. Relieved from duty in Dept. of Texas, and to comply with S. O. 9, C. S., A. G. O. S. O. 92, Dept. of Texas, April 30, 1878.

Newlands, Wm. L., First Lieut. and Asst. Surgeon. Assigned to duty as Post Surgeon at the Angel Island, Cal. S. O. 69, C. S., Div. of the Pacific and Dept. of California.

Styer, Chas., Capt. and Asst. Surgeon. Granted leave of absence to June 30, 1878, and his resignation accepted by the President, to take effect June 30, 1878. S. O., A. G. O., May 3, 1878.

Sanitary Condition of New York Houses.—It is notorious that a large percentage of New York dwelling-houses, especially those not of recent construction, are defective in regard to their sanitary arrangements, the plumbing work is also badly constructed, affording no protection against the escape of dangerous and noxious gases from the sewers, even to sleeping apartments. An instance occurred last week at 114 Waverly Place, which might have had fatal results; as it was, a family of five were prostrated by reason of sewer-gas permeating the whole building. In this case, Dr. Alfred S. Purdy forwarded a report to the Board of Health, which responded with commendable alacrity, immediately dispatching an inspector to survey the premises. The report of Dr. R. L. Wilder fully confirmed the worst suspicions that had been entertained, there were no traps under any of the wash basins or bath tubs, and a free passage for sewer gas was therefore given; the water closets were also defective, and both the soil and sewer pipes were undersized. The Board of Health have given peremptory orders for the necessary repairs and sanitary improvements, and we record with pleasure the prompt attention given by the Board of Health to the requisition of Dr. Purdy; the present case proves how much good can be effected by hearty coöperation between the Board of Health and the medical profession, and we accept it as a harbinger of future good results.

New Sydenham Society's Publications.

THE YEAR 1877, NOW COMPLETE, COMPRISES

I.—THE SECOND VOLUME OF SMELLIE'S MIDWIFERY. Edited and annotated by Dr. McClintock of Dublin.

II.—THE MEDICAL DIGEST. By Dr. N. Neale. This work consists of carefully classified references to the contents of the chief London Medical Journals during the last thirty years.

III.—THE SECOND AND CONCLUDING VOLUME OF PROF. BILLROTH'S LECTURES ON SURGICAL PATHOLOGY AND THERAPEUTICS, with Index.

IV.—THE FIRST FASCICULUS OF AN ATLAS OF PATHOLOGY. Compiled for the Society from original sources, by a Committee consisting of Dr. Gee, Dr. Green, Dr. Moxon, Dr. Sutton, Mr. Holmes and Mr. Hutchinson, with descriptive letterpress.

The Series for 1878 will probably comprise the following, but it must be understood that the Council is not pledged as regards this announcement:

I.—BIBLIOTHECA THERAPEUTICA. By Dr. Waring. Vol. I. Ready.

II.—A SECOND VOLUME OF DR. LATHAM'S WORKS. Collected and Edited for the Society by Dr. Robert Martin. The first volume of this work was issued in 1876, but new members who join from the year 1876 will be allowed to obtain it separately, in order to complete their sets. (Price $2.50.)

III.—A FIRST PART OF MAYNE'S LEXICON OF MEDICAL TERMS. This work will be edited and wholly re-written for the Society by Mr. Henry Power and Dr. Leonard Sedgwick. The copyright of the original work has been purchased by the Society, and it will in future be obtained only by its members. The Society's edition will be so much remodelled and enlarged that it will constitute almost a new work.

IV.—THE THIRD VOLUME OF SMELLIE'S MIDWIFERY. Edited by Dr. McClintock.

V.—A SECOND FASCICULUS OF THE ATLAS OF PATHOLOGY. This fasciculus will conclude Diseases of Kidneys and probably complete Diseases of the Spleen and Supra-renal Glands. It will be accompanied by a short of *resumé* the present knowledge of the Pathology of Kidney Disease. By Dr. Greenfield. With illustrations from the microscope.

Annual Subscription, $10. Payable in advance.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK'S preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proved itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

Physicians, upon examining these pills and giving them a trial, will be convinced that they can rely upon them as confidently as if made under their immediate supervision. They can be procured either through pharmacists or directly from us. The above is only a partial list, and we shall be happy to supply a complete one, priced, and samples of the pills upon application.

W. H. Schieffelin & Co., 170 William St., N. Y.

Druggists when ordering, and Physicians when prescribing, will please be particular to specify *Schieffelin's* Pills.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America—E. FOUGERA & CO., NEW YORK.

TO PHYSICIANS AND DRUGGISTS.

THE subject of Unbleached and Hospital Quinine has been so much discussed of late, and appears to be so little understood, that it is deemed proper to submit the following, which is in accord with our best knowledge and experience in the purchase and use of this article, for it should be remembered that the processes used in the manufacture of Quinine in all countries are kept secret by the various manufacturers, who are a limited number, and said to be comprised within about fifteen establishments of much importance.

Bleached Sulphate of Quinine is recognized as pure when it will bear what is called the ether test, which, while it is not an absolute standard, is the recognized and accepted test, and should be applied in accordance with the directions of the United States Pharmacopœia to all white or Bleached Sulphate of Quinine.

Unbleached Quinine has been regarded with favor in pharmaceutical manufactures, because it has been usually quoted by our manufacturing chemists at from 30 to 40 cents per oz. cheaper than the Bleached, and there has existed among many physicians a prejudice in its favor as a more natural preparation, even if it did contain a small percentage of the other alkaloids of bark. It has been used in general by many of our best and most accomplished pharmacists under this supposition, and was used by us extensively until last fall, when our experiments in manufacturing Quinine from Bark and recovering Quinine from Gelatine-Coated Pills (which we had from time to time rejected on account of irregular shape or imperfect coating) taught us in reality that our previous methods of analysis and determination of this important salt were defective; further, that there were in market two quite distinct articles in proportion of constituents, the one being evidently an arrested manufacture, or Quinine as the result of probably a single crystallization in place of four, as usually required to separate completely the cinchonidia and quinidia, and bring the result up to the ether test; and another article, the result of concentration and crystallization of the so-called mother waters used in successive crystallizations, as before explained, which carry, with the salts of cinchonidia and quinidia in solution to be eliminated, a nearly equal amount of quinia, the result being, as far as our experience goes, from 35 to 45 per cent. of quinia sulphate in combination with cinchonidia sulphate mainly and a small portion of quinidia sulphate.

This latter article, which we have denominated Hospital Quinine to distinguish it from the first described Unbleached (although the terms have often been applied synonymously), we have reason to believe was sent us in the last shipments we received, notwithstanding the manufacturers' contract and our former erroneous method of analysis to the contrary.

The discovery of these facts, on our part, *for the first time* last autumn, led to consultation with several distinguished chemists and pharmacists, and the whole ground was carefully reviewed and examined, and the conclusion arrived at was that all ordinary tests in inexperienced hands for quantitative analysis of Quinine, when it was in natural combination with the other alkaloids of cinchona bark, could not be relied upon, and the only safety in general pharmaceutic manufacture consisted in the use of bleached or white Quinine.

This determination was announced by us last fall in the various journals, as was supposed in sufficient explanation, it having always been our custom to fully explain and inform the trade in regard to our methods of business, which are always open.

We regret only that we are not able to give more specific and positive additions to knowledge about this matter of Quinine and the other cinchona alkaloids, because it deserves and is receiving very much attention and investigation at the hands of Physicians and Chemists as one of the most valuable of all remedies, and that since our change from unbleached to bleached Quinine last November, evil disposed persons have taken occasion to misrepresent and misconstrue the facts for selfish purposes. There are fortunately a few facts that cannot be misconstrued. From our first connection with the inventor of the machinery for making Gelatine-Coated Pills, which commenced with the furnishing of materials for manufacture to the inventor in 1871 till November 24th, 1877, only unbleached Quinine was used, and it was as carefully examined as could be by various analysts until 1876, when our present analyst entered into our employ, highly recommended for general knowledge and experience, and deservedly so outside of Quinology, which is the most difficult of subjects, because of variety in raw material and in alkaloids that are so very similar as to be most difficult of entire separation. Since November 24th, 1877, we have *only used Bleached Sulphate of Quinine* in our Sulphate of Quinine Pills, as stated in our circulars.

We will remark that we believe, as the result of much experience, that a natural combination of the alkaloids of cinchona bark in good proportion is a better therapeutic for general use than any single alkaloid separated, and we attribute much of the favor attending our peculiar form of coating to the use of Unbleached Quinine as employed up to November last in the proportion of 111 ozs (more or less according to our then supposed analysis) in place of 100 oz. of Bleached, as has been formerly carefully explained, but we defer this subject to the experience of the physician, being out of the province of the druggist.

It is the duty of the druggist and pharmacist to be well informed and not to misrepresent or conceal any fact in experience in manufacture or investigation, and we will be pleased to do this at all times when called upon, as only thus can knowledge be advanced or confidence maintained; hence this article, which is respectfully submitted.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HÆMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

MEDICATED DISCS

FOR HYPODERMIC INJECTION.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally that the great demand which has arisen for their **GELATINE PREPARATIONS,** since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS,** and for **OPHTHALMIC PURPOSES,** as well as the **LAMELS FOR INTERNAL USE,** will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 NEW BOND STREET, LONDON, ENGLAND.

In corresponding with Advertisers please mention **The Medical Record**

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

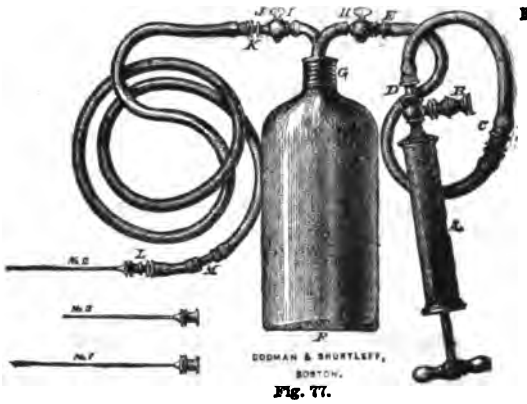

Fig. 77.

Fig. 68.

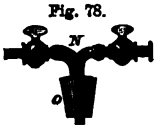

Fig. 78.

The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold-plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions..... $18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case..... $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional..... 6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An Illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

N.B.—See our other Advertisement in alternate numbers of the RECORD.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of .-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties: it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

What will the Weather be To-morrow?

POOL'S SIGNAL SERVICE BAROMETER,

Or Storm Glass and Thermometer Combined

WILL TELL YOU!

It will detect and indicate correctly any change in the weather 12 to 48 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators. Farmers can plant their work according to its predictions. It will save fifty times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. We will send it FREE to any address on receipt of **$2.00.** This great WEATHER INDICATOR is endorsed by the most eminent Physicians, Professors, and Scientific men of the day, to be the ***BEST IN THE WORLD.***

THE

Health Food Company,

74 Fourth Ave., adjoining Stewart's,

NEW YORK,

Would call the attention of the Profession to their

Cold Blast (Attrition) Whole Wheat Flour,

AS AN ADJUNCT IN THE TREATMENT OF

INDIGESTION, CONSTIPATION, and MAL-NUTRITION.

This Flour represents all the Food Elements of the Wheat, the indigestible silex coat being first taken off, and the entire kernel, including the phosphates, etc., being reduced to fine flour by a new process, in which both the admixture of detritus from mill-stones and the injurious effects of heating the flour during preparation, are entirely avoided.

IT IS CHEAPER THAN WHITE FLOUR,

Because it contains nearly four times the amount of the Mineral Substances, for

NOURISHING THE NERVES, BONES, HAIR, AND TEETH.

ATTENTION IS ALSO DIRECTED TO OUR

WHITE WHEAT GLUTEN,

For *diabetes*, and for those requiring the Nitrogenous and Mineral portions of the Wheat, *without starch*. This, like the Whole Wheat Flour, can be made into Bread and Crackers, or may be taken in various ways, and often proves a very valuable remedy for the *Constipation* and *Dyspepsia* associated with many diseases. In excessive fatness, and in disturbed mental states, the Gluten (crude and purified) proves very serviceable.

Circulars, descriptive of these and other Health Foods, mailed to all applicants.

SHEDDEN'S FOODS

WALTER BAKER & CO.,

CHOCOLATE, BROMA AND COCOA PREPARATIONS

Are highly recommended for their great nourishing and strengthening properties, and will be found equally well adapted for invalids as well as those in health.

All warranted PURE and manufactured from selected Cocoa.

Highest Prize awarded at Paris, Vienna, and Philadelphia Exhibitions.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling.

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid, on receipt of price.

Quote MEDICAL RECORD.

BOERICKE & TAFEL'S
Medicinal Triturations.

Our triturations are prepared by carefully triturating in a wedge-wood mortar one part of a given medicinal substance with nine parts of purified sugar of milk, for one full consecutive hour, or longer, as the nature of the drug may require. This preparation is marked 1x signifying one in ten. From this 1x first decimal trituration we again take one part to nine of pure sugar of milk, and by triturating for another hour we obtain the 2x second decimal trituration;—and thus this process is repeated.

These triturations we furnish at the uniform rate of:

One oz. vial for 25 cts. Two oz. vial for 45 cts.
Four oz. " 85 " Eight oz. " 1.60 "
One pound for $3 00.

For triturations, however, where the crude material is very expensive a proportionate increase in price will be made. Thus remedies marked with an asterisk (*) in our list are double the above rates in the first decimal (1x) trituration, and those marked with a dagger (†) are at double rates in the second decimal (2x) trituration; and finally, those marked with a query (?) are furnished at special rates.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.

REPORT OF JUDGES.

"Novelty, great value in pharmacy, unequalled purity, and superiority of manufacture."

The attention of physicians, druggists and hospitals, is called to this article, and to the fact that it is favorably regarded and extensively used both in the United States and England, by the profession, and by pharmacists for OINTMENTS, CERATES, &c

As a dressing for WOUNDS, CUTS, BRUISES, BURNS, SPRAINS, PILES, RHEUMATISM, SKIN DISEASES, CATARRH, SORES or ERUPTIVE DISEASES, and all contused and inflamed surfaces, it is not equalled by any known substance.

In the treatment of **COUGHS, COLDS, CROUP, DIPHTHERIA,** and of **THROAT** and **CHEST** complaints the best results are obtained.

One-pound Cans, $1.00. Five-pound Cans, $2.50.

CHESEBROUGH MANUFACTURING CO.,
110 FRONT ST., NEW YORK.

Pomade Vaseline, Cold Cream, Vaseline Camphor Ice, and Vaseline Toilet Soap, are all exquisite toilet articles made from pure Vaseline, and excel all similar ones.

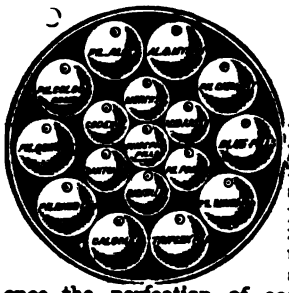
Printed Pills and Granules



These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

30 North William St., New York.
SOLE AGENTS FOR THE UNITED STATES.

CONCERNING
BELLADONNA PLASTER
A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

DR. J. M. GROSVENOR, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affecting the combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U.S.P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon-like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonna Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J. M. GROSVENOR, M.D., (accompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a *cheap* product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicains, if unable to obtain Dr. Grosvenor's Improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., *22 Park Place,* **NEW YORK.** or **GROSVENOR & RICHARDS,** *97 Oliver Street,* **BOSTON.**

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

McKESSON & ROBBINS'

GELATINE-COATED PILLS.

QUININE, CARBOLATE, 1 gr.

QUININE, SALICYLATE, 1 gr.

QUININE, SULPHATE, 1-4, 1-2, 1, 1 1-2, 2, 3, 4, & 5 grs.

QUININE, BI-SULPHATE, 1-4, 1-2, 1, 2, 3, 4, & 5 grs.

QUININE, SULPHO-CARBOLATE, 1, 2, 3, and 5 grs.

This Salt of Quinine has been very much used in some of our extreme malarial districts during the past two years. Those who have tested it very carefully, claim that it possesses a most positive specific action in the treatment of fever and ague, and has proved itself eminently superior to the Sulphate of Quinine in all malarial fevers.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
" Case of 50 Pint Jugs.....8.00 "
Less discount according to quantity.

FOR SALE BY ALL DRUGGISTS.

Quotations for quantities may be had, as well as circulars, free from

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 18, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynaecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT, Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

189 Elm Street, New York.

THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

Works of Prof. Alfred L. Loomis, M.D.,

Professor of Pathology and Practical Medicine in the Medical Department of the University of the City of New York; consulting Physician to the Charity Hospital, to the Bureau of Out-Door Relief, to the North-Western Dispensary, to the Central Dispensary; Late Visiting Physician to the Blackwell's Island Fever Hospital; Visiting Physician to Bellevue Hospital, to the Mount Sinai Hospital, &c., &c.

LESSONS IN
Physical Diagnosis.

THIRD EDITION. REVISED AND ENLARGED.

In one handsome octavo volume, cloth, **$3.00.**

NOTICES OF THE PRESS.

"The previous editions of this volume have been very well received, and, from their ready sale, appear to meet a well-recognised want. . . . We find the plan of the work excellent, and, within the limits proposed by the author, very well carried out. It would be easy to point out many omissions; completeness and conciseness to a certain degree exclude each other; but in the space assumed, it would be difficult to include a greater variety and amount of sound teaching. The style is compact, clear, positive, and exact. It is free from all irrelevant discussions; nothing is allowed to disturb or confuse the distinct image of clinical facts. . . . The book is very creditable to its acute and industrious author; and whoever shall practically master its contents cannot fail to be a discriminating and well-furnished diagnostician."—*The Medical Record.*

"For students it is the best work on physical diagnosis that is published."—*Detroit Review of Medicine.*

"This is a work already well and favorably known to the profession. In the present edition the original text has been entirely revised and enlarged by the addition of five new lessons."—*Chicago Medical Examiner.*

"Students of medicine and practitioners will find this just the work to meet their wants on the subjects of which it treats. Its instructions are full and very plain."—*Cincinnati Medical News.*

"The previous editions of the work, confined to an exposition of the subject of physical exploration of the chest and abdomen, we have regarded as among the very best works on the subject extant, and hence recommended 'Loomis on Physical Diagnosis' to our classes; and it gives us pleasure to repeat, in this form, our hearty commendation of the book."—*Mich. University Medical Journal.*

LECTURES ON
Diseases of the Respiratory Organs,
HEART AND KIDNEYS.

In one handsome octavo volume of over 550 pages. Price, in extra muslin, **$5.00**; *or, in leather,* **$6.00.**

NOTICES OF THE PRESS.

"It is clear in style, convential in arrangement, very definite and practical in its teachings."—*Philadelphia Medical Times.*

"We like the systematic method in which these lectures are arranged, and regard them as excellent in every way."—*Cincinnati Lancet and Observer.*

"By all means buy Loomis' work and *study* it."—*Ohio Medical and Surgical Reporter.*

"In the one before us the reader may look confidently for the last words on the subject, and may rest assured that what the author has here committed to the press is the result of much learning, sound judgment, and thorough experience."—*American Practitioner.*

"We have no hesitation in pronouncing it one of much value to the profession, and highly creditable to the author."—*New York Medical Journal.*

"While the views presented are fully up to what is actually known on the subjects treated, the doctrines are judicious and safe. At the same time they are presented with unusual clearness, and with sufficient positiveness to command confidence."—*New Orleans Medical and Surgical Journal.*

LECTURES ON
FEVERS.

In one handsome octavo volume. Cloth, **$4.00**; *Sheep,* **$4.75.**

NOTICES OF THE PRESS.

"We have before us, therefore, a book containing statements of practical facts relating to certain diseases, and the theories regarding their nature, mode of origin and propagation, and arranged so as to be easily comprehended by the medical student. We also believe they will be read without weariness by the daily practitioner. . . . It contains much practical knowledge, and cannot fail to be read by a very large proportion of the medical profession; for a concise statement of facts—with only such qualifications as can be safely indulged in without endangering perspicuity—is always acceptable."—*The Medical Record, Aug.* 24, 1877.

"This last work of Professor Loomis' is a valuable contribution to medical literature. His treatment of the subject is mainly practical, and is in strict conformity with what the author has himself observed at the bedside. The general management of fever is justly regarded of greater importance than the administration of drugs. It is a book that will well repay careful study."—*Western Lancet, January,* 1878.

"The work is clearly and concisely written, and will be useful and acceptable to both student and practitioner."—*N. Y. Medical Journal, March,* 1878.

"In this interesting volume, which contains the lectures on fevers delivered by Professor Loomis to his class during the last year, we have a concise and impartial review of the literature concerning fevers, which has been published since 1850 with reference to a few older books, 'because they contain many of the so-called new theories and modes of treating fevers.' In this are embodied the results of the author's own extensive clinical experience, which has led him to form opinions in certain respects at variance with those of some other observers; and the weak points of theories and modes of practice which have not stood the test of time, are clearly set forth."—*Boston Medical and Surgical Journal, Dec.* 27, 1877.

Sent by mail, post-paid, on receipt of price.

BELLEVUE HOSPITAL
MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	25 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

COLLEGE OF MEDICINE

(Medical Dept. Syracuse University),

SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE, OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1878, and continue twenty-six weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 37 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1877, and continue until the last Wednesday in February, 1878. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1878, and continues 12 weeks.

FACULTY:—G. C. E. WEBBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL PORTERFIELD, M.D.; D. B. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GERTISCH, P.C. For Circular and Catalogue, address H. W. KITCHEN, Sec'y, No. 3 Euclid Avenue, Cleveland, O.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary, BRUNSWICK, ME.

WANTED. Those of our Subscribers who have received duplicate copies of Nos. 323 & 361 of THE MEDICAL RECORD will greatly oblige the Publishers if they return them by mail to WM. WOOD & CO., 27 Great Jones St., New York.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. BUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.
For circulars, address DEAN or REGISTRAR.

BY MAIL OR EXPRESS.

MEDICAL BOOKS.

Messrs. Wm. Wood & Co. desire the consideration of the Medical Profession to their unequalled facilities for supplying Medical Books. Having been the heaviest dealers in their specialty for many years, and having the largest variety in stock to be found anywhere, they can usually fill any order sent them immediately.

Particular attention is paid to filling orders for *single books by mail or express.* When sent by mail, the regular retail price is charged, to cover cost of postage and extra care in wrapping. Single volumes, or larger numbers, when sent by express C. O. D., are charged at a discount of *Ten per Cent.*

ILLUSTRATED CATALOGUES of their own publications, and COMPLETE MEDICAL CATALOGUES of all works in the market, and Catalogue of New Sydenham Society Publication will be sent FREE ON APPLICATION to any address.

Publishers of the following Medical Journals:

THE MEDICAL RECORD,
NEW REMEDIES,

Paris, 1867. Prize Medal.

1868. Silver Medal.

1872. Gold Medal.

Vienna, 1873. Medal of Merit.

Philia., 1876. Medal of Merit.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the "***La Plata,***" since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

In corresponding with Advertisers please mention **The Medical Record.**

Warranted that the register of this thermometer will not unite with the mercury in the bulb A.

F. G. Otto & Sons' Patent Truss Pad.

The advantages this Thermometer possesses over *all others*, consist in the reservoir B, in which the registering part of the mercury is collected, forming a body of oblong shape. The surface of this body being large in comparison to the contracted bore, makes it impossible to unite the register with the mercury in the bulb A.

These Thermometers are well seasoned before graduating, and, consequently, are as correct as they can be made.

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material; the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's, and all other shapes. *Manufactured only by*

F. G. OTTO & SONS, 64 Chatham Street, New York.

ROSCOE.

Lessons in Elementary Chemistry,

ORGANIC AND INORGANIC.

By HENRY E. ROSCOE, B.A., F.R.S.,

Professor of Chemistry in Owen's College, Manchester, England.

SECOND EDITION.

With a Chromo-Lithograph of the Solar Spectra. In one very neat 18mo volume, fully illustrated, bound in muslin, red edges.

PRICE, $1.50.

NOTICES OF THE PRESS.

"It has no rival in its field, and it can scarcely fail to take its place as *the* text-book at all schools where chemistry is studied."—*Chemical News.*

"We regard Dr. Roscoe's as being by far the best work from which a student can obtain a sound and accurate knowledge of the facts and principles of rudimentary chemistry."—*The Veterinarian.*

"We should be gratified to see this little treatise find its way into the hands of all medical students who begin their course in chemistry."—*St. Louis Medical and Surgical Journal.*

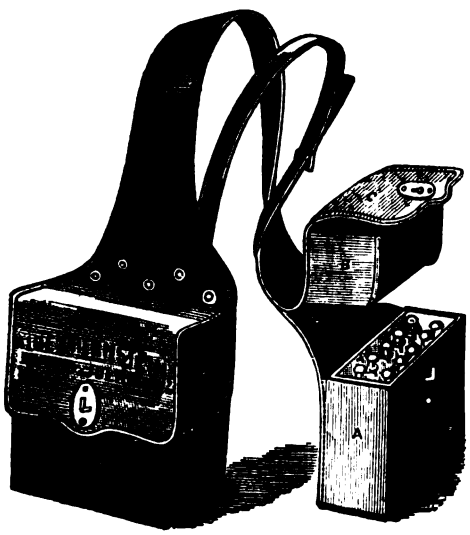
ALOE & HERNSTEIN'S

IMPROVED

PHYSICIAN'S SADDLE BAG.



This Bag is the most complete and durable Bag in the Market, and will give the best satisfaction to the Profession of any Bag ever offered. The Bag is entirely riveted with copper rivets, thereby doing away with the old style of sewing, which has been the great objection heretofore. The boxes containing the bottles are made of the best Tin Metal. A, is the metal box containing the bottles; B, is the box used to carry instruments, powders, etc.; C, is the flap, which holds the upper and lower boxes, A and B, firmly together, being fastened by a turn lock, which holds the contents in their place; D, represents the bag when closed. It is the only bag made that has a complete water-shed to prevent the contents from getting wet.

PRICES.

For Bags containing 20 Ground, Stoppered Vials $12 00
" " 24 " " " 13 00

Made of the best Black Bridle Leather.

For Bags containing 20 Ground, Stoppered Bottles $13 00

8vo. Cloth. Price $2.00.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

By SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adults."—DR. DESSEAU *in Medical Record, July* 28, 1877.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

SENT BY MAIL, POSTPAID, ON RECEIPT OF PRICE.

THE ELEMENTS OF THERAPEUTICS.

A CLINICAL GUIDE TO THE ACTION OF MEDICINES.

By DR. C. BINZ, Professor of Pharmacology in the University of Bonn.

Translated from the Fifth German Edition, and edited, with additions, in conformity with the British and American Pharmacopœias.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface).....**$0.25.**
Capillary Tubes,..... **1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets.; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

Drs. ROBBINS & LEWIS, 94 Pineapple Street, Brooklyn. *Quote* MEDICAL RECORD

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, (Humanized, first removal from heifer.) each, . . *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

In corresponding with Advertisers please mention THE MEDICAL RECORD

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt. with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

SUPERIOR TO PEPSIN OF THE HOG.

A Powder;—prescribed in the same manner and the same combinations as Pepsin.

*INGLUVIN.

Ventriculus Callosus Gallinaceus.

(From the GIZZARD of the DOMESTIC FOWL.)

A SPECIFIC FOR VOMITING IN PREGNANCY.

A potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

PREPARED BY

WILLIAM R. WARNER & CO.,

1228 Market Street, Philadelphia,

PHYSICAL SIGNS OF INTERPLEURAL PATHOLOGICAL PROCESSES.

By J. R. LEAMING, M.D.,

SPECIAL CONSULTING PHYSICIAN IN CHEST DISEASES FOR ST. LUKE'S HOSPITAL, NEW YORK.

In health the pleuræ are smooth, opposing surfaces, free in motion, and lubricated by their natural secretion. They cover the inner costal wall, the outer surface of the pericardium, nearly the entire upper surface of the diaphragm, and all the surfaces of the lungs. They help to form the mediastinum, and surround the origin of the great vessels and of the air-passages. In short, they line the great acoustic chamber of the chest, and cover the sound-producing organs which it contains. The constant motion of these organs gives voice to their action, and breathes into the ear of the auscultator an harmonious idyl of health, or whispers and mutters of the discordances of disease.

The acoustic properties of the normal chest are so perfect that the most delicate signs, such as true respiratory murmur or aortic regurgitation, are delivered through its walls to the ear without loss or change. The healthy pleuræ are no obstacle to the free passage of sound, and at the same time are no cause of sound in themselves. It is like looking into an open room filled with light.

But at the first trace of an inflammatory process they cease to be silent themselves, and modify or prevent sound passing through them. It is like looking into a room filled with cloud, through obscured glass; nothing is clearly seen.

The pleuræ are prone to diseased change. Mental depression, physical exhaustion, or sudden alternations of temperature, may cause hyperæmia, and plastic exudation is then likely to follow. It is a vital process, but indicates a diseased condition of organic life. It occurs in cellular tissue and on serous surfaces—very frequently on the pleural. Comparatively few autopsies are made without discovering more or less of interpleural thickening and adhesions.

"Physicians of old did not regard them as preternatural; nor do many at the present day consider them as necessarily connected with inflammation. This opinion is founded upon the fact of these adhesions being met with in individuals not known to have suffered from any inflammatory affection of the chest. But, until satisfactorily traced to some other cause, it would appear more proper to refer these exclusively to an inflammatory origin." (Hasse's *Path. Anat.*, p. 182.) The process may be summarized as follows:

First, local vital exhaustion, vaso-motor paresis, stasis, hyperæmia; then the white globules, "the wandering amœba," pass through the meshes of the walls of the capillaries, and, unless immediately absorbed, organize and result in adhesions and thickened pleura.

More or less of impaired health follows, with obscure symptoms. New exudations take place from time to time, crippling the respiratory organs, and seriously implicating the circulation, until the patient dies, worn out, with resulting complications of all the vital organs.

These serious pathological results have hitherto been unrecognized, except in part and inadequately, during life by physical signs. In March, 1870, I had the honor of reading a paper before the New York Academy of Medicine on Pleuritis. In the discussion which followed, Dr. Flint, Sr., remarked that "He was not aware that there are any distinctive physical signs of permanent adhesions, that can be depended upon as pathognomonic." This was undoubtedly then, and perhaps is largely yet, the received opinion of the profession, Dr. Walshe alone, among the authorities, interpreting certain physical signs as of adhesions and pleural thickening. I had adopted from my teachers the generally received opinions; but considerable clinical experience, obtained in the class of chest diseases at Demilt Dispensary, caused me to question their truth. There were repeated occurrences which seemed to me to furnish incontrovertible proof that many of the physical signs of the chest had been misinterpreted. But even yet I was not prepared to give up my preconceived idea of the local origin of mucous and crepitant râles.

But about ten years since, a patient came into St. Luke's Hospital, from Bellevue, with a disputed diagnosis. The case had been affirmed to be one of simple hydrothorax, and then again to be hydropneumothorax. Both opinions were correct. Upon examination it was found on the right side that there was dulness and loss of respiratory murmur up to about three inches above the diaphragm; and bordering the upper line of dulness, and encircling the lung, there was crepitus and subcrepitus. It was simple circumscribed hydrothorax. But upon directing the patient to take a forced inspiration and hold the breath, air was forced into the artificial chamber made by the adhesions, and the case was immediately changed into one of hydropneumothorax. In a little while the air escaped, and the case was as at first. To account for this it was necessary to suppose that there was a valvular opening, through which air could come from the lung. The fluid was removed by intercostal incision, and the case kept under observation. After a time, the left side showed signs of disease. There were mucous râles and gurgles, and progressive loss of weight and strength. The case was frequently referred to as an example of tubercular phthisis. The râles were of various sizes, and were considered as signs of tubercular infiltration and honey-combed cavernules.

At the autopsy the circumscribing adhesions, with the valvular opening in the lung, were found on the right side, as was expected; but, to our astonishment, there was no structural change in the left lung. Between the pleural surfaces, however, there was a large amount of plastic exudation, together with a small quantity of viscid fluid; at many points also there were firm adhesions. These interpleural deposits were evidently the only source of the sounds I had misinterpreted as signs of the tubercle and tuberculous cavities of small size. I was convinced that the same conditions had frequently deceived me in other cases.

Since then, I have, in repeated instances, carefully noted and recorded the locality of râles and their distinctive characteristics, for the purpose of testing them in relation to pathological conditions, to be revealed by autopsies. In no instance have I found them to disagree with the interpretation that their cause lay in an interpleural process.

The following case is one in which old, firm, and close interpleural adhesions drew the heart upwards, and caused murmurs by displacements.

CASE I.—J. S. T., an honored member of our profession, called on me in company with Dr. Otis, in the spring of 1876. About seven years before he had

pleuro-pneumonia, and several times since slight attacks of pleurisy. He was short of breath, and distressed after exertion, or on going upstairs; he had at times severe pain in the region of the heart like angina. Aneurism of the aorta and valvular disease of the heart were feared.

Examination discovered some dulness at the summits of the lungs. There was flat wooden percussion note over both. There was very little expansion, and the movement of the chest was restricted. There were a few râles of various sizes over the greater part of the chest. At the lower angle of the scapula of the left side, there were no râles, nor any movement of the lung even in forced inspiration, but coughing produced short fine crepitus immediately under the ear.

True-respiratory murmur was feeble generally, but absent at the apices of both lungs. The apex beat of the heart was between the fourth and fifth ribs, a little to the left, and there was a systolic murmur.

Diagnosis: old extensive adhesions over both lungs; no disease of the heart or of the arteries.

On the 12th of October, 1876, he received a wound, to the right of the sternum over the right auricle, by a piece of a brass tube imbedding itself in the lung and the pericardium. Pericarditis and pneumonia followed, and he died on the 20th.

The day before his death, and probably for some time previously, there were abundant soft "mucous" râles. These were diagnosticated also as interpleural. The autopsy revealed pericarditis and pneumonia of the whole of the right lung, which was consolidated—the mould of the ribs remaining on its surface after it was removed from the chest.

Hence, no air could have entered the lung. New exudation had taken place among the old adhesions, and efforts at respiration moved the chest-wall over the solid lung, thus producing "mucous râles."

Case II.—Is kindly given in a letter from Prof. J. L. Little, and is equally decisive: "My dear Doctor, I cheerfully comply with your request, that I would furnish you with the points in the history of a case bearing on the subject of your paper. I was called to see a patient in consultation with Dr. Roëdiger, on August 14th last, and found a man about forty-five years of age, who was suffering slight pain in the left side—no cough, no expectoration, high temperature and frequent feeble pulse. On auscultation, subcrepitant râles could be heard on the posterior surface of the left side of the chest. These were more abundant and of a much coarser quality at the upper part of the lung, although more or less subcrepitation could be heard from apex to base. On percussion, flatness was discovered over the entire upper portion of lung; the lower showed but slight dulness. I saw the patient in consultation on the 17th, 18th, and 19th. At the last visit, eighteen hours before death, subcrepitation was heard, as at first examination. On forced expansion after coughing, the râles were markedly increased in number, and seemed to be very near the ear. Patient died August 20th. Autopsy by Drs. Roëdiger and Nesbitt. Left lung was found solid with pneumonia, except the lower part of the inferior lobe. The upper was in a state of gray hepatization, the middle red. The lower part was very much congested, but crepitated on pressure. The pleuræ were covered with plastic exudation, but the adhesions were slight. The false membrane covering the upper third of the lung was three or four millimetres in thickness. The lower portion was covered with only a thin layer. In this case, Doctor, the râles heard over the posterior surface of the chest were without doubt due to the exudation on the surface of the pleuræ. No air could possibly have entered the upper or middle portions of the lung for some days before death.

"Yours truly, J. L. Little."

These two cases are evidence of a positive character verified by post-mortem examination.

Case III.*—C. M., saleswoman, eighteen years old, came to my office for examination on the 14th of September, 1877. Percussion-note dull over lower part of left lung in front and up to the middle of interscapular space behind. There was bronchophony, bronchial breathing with subcrepitant râles. At the lower portion of the lung in front was *fine crepitus*. As the lung was consolidated by pneumonia no air could enter it, and consequently the râles must have been in the pleuræ. This evidence is further corroborated by the fact that since then the pneumonia has cleared up, resonance returning, but subcrepitant râles remain in place of the crepitant.

These three cases may be regarded not as unusual, but as typical, and they furnish proof: 1st, That mucous, 2d, that subcrepitant, 3d, that crepitant râles may all have their local origin within the pleuræ.

It is difficult to overcome preconceived opinions even with evidence perfectly conclusive to an unprejudiced mind. Still the facts, which I have given, and others which I shall further relate, must commend the subject to all candid observers.

Has the generally received opinion that all large, soft, moist râles are caused by bursting bubbles in the bronchi ever been put to the test of careful experiment? On the contrary, is it not the general experience that abundant mucous râles may exist without expectoration, and profuse expectoration without râles, or only with such as are distant from the ear, and which disappear upon expectoration? Has not the received opinion that all the râles of whatever size, liquidity or dryness, have their origin in the lungs, and that the size of the bronchia determines the size of the râle, been adopted by pupil from teacher, from the time of Laënnec to the present, without regard to the obvious fact that the large râles are most frequently heard over portions of the chest where the bronchial tubes are very small, and the small râles where they are large?

Early auscultators explained the respiratory murmurs of health, as well as the rhonchi of disease, as being formed by the air passing through the bronchi into the vesicles and out again;—that the friction of this body of air in motion caused vesicular murmur and bronchial breathing; and that should mucus collect, it would be moved along bursting bubbles in its way—crepitant, subcrepitant and mucous, according to the size of the râle. Later, another theory was proposed, and by many adopted, which still regarded the size of the tube as governing the size of the râles. According to this theory, the tube being lined with adhesive mucus, collapsed after expiration, and the sides cohering, inspiration would again force them apart, causing râles. Neither theory recognizes obstruction to the free passage of air into the air-sacs and out again, yet the residual air certainly occupies the true respiratory system and does not admit air moving in a body. The tidal air physiologists estimate to be about one-tenth part of that in the lungs. So that after expiration there still remains nine-tenths, occupying the true respiratory system. This is the residual air. When inspiration again takes place the

* This case is of a class common to all practitioners, and is introduced as such. It has no novelty, but after the post-mortem evidence of Cases I. and II., the clinical evidence of consolidated lung becomes proof of the impossibility of the râles being interpulmonary.

column of *in*-moving air passes in a body to about the third or fourth division of the bronchia, and can go no further, but mixes with the residual air, obeying the law of the diffusion of gases.

It is evident, in view of these facts, that both theories are impossible. The existence of so large a mass of residual air in the air-cells and smaller bronchial tubes, and also the existence of consolidated lung tissue (in which solid material fills the spaces previously occupied by the residual air), both show conclusively that all râles called crepitant and subcrepitant, when heard under these conditions are not intrapulmonary, and that mucous râles, when not clearly traceable to the large bronchi, are also not intrabronchial, and consequently all râles not clearly traceable to the larger air-passages are interpleural.

Mucus in the upper bronchia may cause *mucous râles*, which are intermittent. The mucus accumulates, the râles are heard; it is expectorated, and they are gone. In suffocative catarrh, and in approaching dissolution, the râles are continuous.

It would seem possible that fibroid lung could also produce subcrepitation in cases where the lung is adherent to the chest-wall. But of this I have no proof.

The following case of fibroid phthisis was characterized by a variety of râles and rhonchi, which would deceive any one who did not recognize them as signs of an interpleural pathological process. They were very suggestive of cavernulous phthisis and of disease of the heart.

Case IV.—W. S——, about sixty years of age, merchant, while in Scotland in 1874, had pneumonia, and since then had had frequent colds, causing short, spasmodic cough, with gradual increasing dyspnœa. He came under my care early in 1876. His breath was short and hurried. There were râles over both lungs; in some places coarse and rattling, and in others smaller, even fine crepitus. At the lower part of the right interscapular space, and below the scapula, they were coarse, moist, and gurgling. Under the right axilla down to the diaphragm there were creaking as well as dry râles. Under the left clavicle there were mucous gurgles, and under the left scapula there were fine crepitant and subcrepitant dry râles. There was general flatness under percussion, with raised pitch over most of the chest. There was an audible systolic murmur at the apex beat. The impulse was felt almost as high as the nipple, and there was also impulse in the second interspace.

The diagnosis was extensive plastic exudation between the pleural surfaces, forming adhesions which had drawn the lungs and heart upward. The dyspnœa and cardiac complications were the consequence of these changes, and there was no other serious lesion. At first he improved under treatment, and gained more than an inch in chest expansion, and was able to get about with much less difficulty than before treatment, but in May an attack of pneumonia increased the amount of plastic exudation, and he lost more by subsequent contraction than he had previously gained in expansion. During the summer, in the country, he was under the immediate care of Dr. Ely, of Newburg. He was able at times to ride out, but renewed attacks of exudation lessened his vital capacity, and finally, after another "cold," he had increased disease, from which he died Oct. 8, 1876.

Autopsy by Prof. Delafield, Oct. 10th. Present, Drs. Jones, Dudley, G. A. Peters, Ely, and Leaming.—"Body much emaciated, cadaverous discoloration already evident on abdomen. *Pericardium* contains a little serum. Apex of heart on level with lower edge of fourth rib—distant three and one-fourth inches from median line. Upper border of heart on level with lower edge of first rib. Long axis of heart turned somewhat in vertical direction.

"*Lungs.*—Left side, very extensive old adhesions covering the entire lung. Left lung, upper lobe at the apex, some bands and patches of pigmental fibrous tissue. Lower lobe, lower third, bands of new fibrous tissue and red hepatization—the red hepatization is recent. Right lung, old adhesions over entire lung. Upper lobe, the same diffuse fibrous tissue, but more abundant.

"*Heart.*—Right ventricle contains large yellow post-mortem clot. Pulmonary valves a little thickened at their attached edges. Ventricle a little dilated, walls of normal thickness, tricuspid valve a little thickened.

"*Left ventricle* contains a small post-mortem clot. Cavity rather diminished. Walls normal thickness.

"*Aortic valves* somewhat atheromatous and stiffened, and on ventricular aspect of one leaf a small fibrous projection. Mitral valve a little thickened and atheromatous.

"*Kidneys.*—Normal size, capsule not adherent, surface smooth, cortex normal in appearance and thickness. Aorta markedly atheromatous."

(Signed) Francis Delafield.

In this instructive case the physical signs were interpreted during life to mean just what was found at the post-mortem examination.

It is needless to say that the ordinary interpretation would have made out a diagnosis of phthisis with cavities and structural disease of the heart as the cause of death. Is it not important that such a mistake should be avoided?

The first step in these complicated pathological changes was plastic exudation between the pleuræ, which, becoming organized, formed adhesions, and these in turn gave rise to all the subsequent diseased conditions in the lungs and of the heart.

Case V.—M. M., æt. 40, single. Saw her in consultation with Dr. E. D. Hudson, Jr., September 7, 1877, morning. Heart and great vessels gave no evidence of disease. Pulse and cardiac sounds were feeble and frequent, suggesting fatty degeneration. Chest expansion was not more than half an inch; respiratory murmur very faint; very little air entering the lungs. No disease of the lungs or pleuræ was discovered. But there was evident obstruction in the air-passages, the patient gasping for breath. Lung free from dulness. Highest local pitch in respiration traced to the larynx, and the obstruction was believed to be at this point.

The laryngoscope, in the skilled hands of Dr. Lefferts, proved this opinion to be erroneous.

Evening.—Consultation with Drs. Hudson and Lincoln. There was now found, at the summit of the left lung, perceptible dulness and flatness under percussion, and soft tearing râles in auscultation, conditions which had developed since morning. Respiration was more difficult, and during the examination became so great that unconsciousness resulted. No time was to be lost, and Dr. Lincoln performed tracheotomy, and the obstruction was found to be below the trachea. No evidence of aneurism was discovered. Dr. G. F. Shrady informs me that he refused to give this patient ether for an operation previously, because he suspected aneurism. Death occurred early on the morning of the 8th.

Autopsy, afternoon of the same day, by Dr. Hudson, in the presence of Drs. Lefferts, Hitchcock, and Kemp.—"Cause of death, aneurism at the posterior surface of arch of aorta descending. Trachea and bronchia

atrophied by the pressure of the tumor. Heart fatty, lungs reduced in volume, but normal otherwise. At the left apex the opposed pleural surfaces were agglutinated, the soft adhesions offering slight resistance in separating. Several older, organized but elastic adhesions spanned the left pleural cavity." (Notes of the autopsy kindly furnished by Dr. Hudson.)

This case is evidence that plastic exudation may be diagnosticated as soon as it takes place. There were neither râles nor dulness in the morning, but there were both in the evening, and fresh plastic material was found at the autopsy. Hasse says: "The first appearance of inflammation of the pleura consists in a congested state of its blood-vessels, which are seen congregated here and there, in dense, though delicate nets, beneath the still transparent membrane. At certain points the bright-red color deepens and becomes more equalized; these points are somewhat prominent, and, though scattered at first, presently crowd together and get encompassed with a progressively enlarging zone of gorged blood-vessels. At the same time patches and streaks are observed either darker than the rest, and not unlike little ecchymoses, or else of a pale red hue, as if from imbibition. The pleura now speedily loses its smoothness and polish, becoming dull and looking, as Laënnec expresses it, as if daubed over with a paint-brush. This redness gradually spreads until in most instances the whole, says 'Gendrin,' becomes uniform.

"The first rudiments of an adventitious membrane now become perceptible, the spots originally reddened, and that chiefly by repletion of the vessels, presenting little dull white or yellowish points which rise above the serous surface in the shape of flat granules, and ultimately coalesce." (Hasse's *Path. Anat.*, p. 183.)

All of the pathological changes described above, from the first congested blood-vessels in nets to the final covering of the whole pleura with lymph, produce the following signs: First, muffling; second, alterations of the respiratory murmur; and then, finally, râles and rhonchi, indicating exudation of plastic material. Every step of the pathological process is characterized by its appropriate physical signs.

Experience and a nice education of the ear make an early diagnosis easy and certain, and enable the practitioner to use remedies which, if employed in good season, remove the disability and the danger.

Case VI.—(Plastic signs removed by hygiene.)—F. J., about 26 years of age, while at business in Wall Street, in 1874, suddenly began to raise blood, and came immediately to my office. There was an area over the right scapula, where soft tearing râles could be heard, and there was also flatness under percussion. He was advised to take a walking expedition of two or three weeks' duration. This he did, and returned in health, not a vestige of the plastic râles remaining; nor has he had any return of chest signs or symptoms since.

It is possible that had he remained at his exhausting business under all the depressing influences which had produced their conditions, his lowered vitality would have been still farther depressed, and his case would have resulted in phthisis, as many others have done—so important is it to connect physical signs correctly with their true pathology.

Plastic exudation upon the pulmonary pleural surface has the immediate effect of obstructing the capillary circulation in that part of the true respiratory system which subtends the deposit. If it is not quickly reabsorbed, it becomes organized, and contracts, causing still greater obstruction. Hæmoptysis frequently results—it may be immediately, but in most cases not until after two or three weeks, or even longer.

The reason of this is evident, if we consider the minute anatomy of the circulation of the true respiratory system. The nutrient arteries of the lungs are derived principally from the bronchial, and differ from all others in the body, in the fact that they have no returning veins; no *venæ comites*. The nutrient capillaries after performing their special function, anastomose with the radicles of the pulmonary vein, and their blood is reaërated even while performing its office, and hence, notwithstanding this apparent anomaly, arterial blood is alone forced into the left heart.

Consequently obstruction to the nutrient capillaries throws their blood back upon the bronchial arteries, which might seriously interfere with the circulation, except for a provision of nature, by which mucus is exuded copiously through the mucous membrane (bronchorrhœa), or perhaps blood (bronchorrhagia). So that either may be an important symptom of plastic exudation, and if carefully sought for, the plastic râles will be found.

Case VII.—G. B., a distinguished surgeon, April 1, 1876, had pneumonic sputa; pulse 100, temperature 100°. Had some oppression in breathing, but no pain. Auscultation discovered no râles on either side. True respiratory murmur was everywhere good, except over a part of the middle lobe of the right lung—a space about as large as the palm of the hand—where there were also perceptible dulness and raised pitch. Diagnosis: Centric pneumonia of the middle lobe of the right lung. The next day the pulse was 70 and the temperature 97°. Sputa the same as the day before, and so it remained on the 3d and on the 4th. Subsequently, the temperature was as as low as 93°.

On the night of the 5th of April he suffered great dyspnœa, and auscultation found abundant râles of crepitant and subcrepitant size, covering that part of the middle lobe of the right lung, posteriorly, over which true respiratory murmur was absent at the first examination on the 1st of April. The centric pneumonia had extended to the pleural surface, exudation had joined the pleuræ together, and crepitant râle and bronchial breathing were plainly heard. The dyspnœa from which he suffered was the consequence of these adhesions.

He gradually improved until the 27th of April, when he went to Fortress Monroe for change of air. Shortly afterwards he had a return of dyspnœa, and as it increased, he came home on the 5th of May. He now had moist tearing râles low down on the *left side*. The heart was restrained in motion, and the first sound was altered in character. These signs indicated fresh plastic exudation in the left pleural cavity, as a result of which attachments had formed with the pericardial sac, and with the lung, altering the heart sounds and giving an intraventricular murmur at the apex. During the rest of the month of May and of June following, there was progressive plastic exudation, invading more and more of the pleura, and causing distressing dyspnœa.

From the first there had been albumen in the urine, with some casts. But in July there was notable improvement in all the symptoms; yet the râles remained, and exercise was exhausting. In the latter part of August he returned to the city and attended to some professional duties; was out riding daily, and visited the hospitals. But late in the autumn one chilling day, at the hospital, he took cold, and was

again obliged to keep his room. There was another advance in plastic exudation in the left side; the heart was more restrained by tightening bands of adhesions; there was general and gradual failure in health, until the 6th of March, 1877, when he died.

Autopsy by Dr. Abbe.—"March 7, 1867—*Pleura:* Each cavity contained about a pint of clear serum.

"*Right lung*, bound by old plastic adhesions over pectoral and inframammary regions and to the pericardium; latterly over entire axillary region, and somewhat below, though not to the diaphragm. Posteriorly along spine up to the summit of the lung, where the apex was completely adherent.

"*Left lung.*—Apex adherent and firm, thence extending along the spine two-thirds downward to base of lung; also bound at upper part of subscapular region. Three or four fine bands of recent plastic extended from pericardium to left lung. The lungs were not diseased.

"*Liver* somewhat contracted and fatty. Gall-bladder contained perhaps a dozen small concretions not larger than mustard seeds.

"*Spleen* somewhat hard and fibrous, tightly adherent to extreme of left lobe of liver by old and thick adhesions; also adherent to peritoneal wall, to the omentum, and to a little of the intestines.

"*Kidneys.*—Both somewhat contracted, the right much more than the left, weighing about three ounces; both somewhat cirrhotic and granular, and containing numerous small cysts, varying from the size of a small pea to that of a bean; both congested.

"*Heart* considerably enlarged; valves ample, but somewhat thickened (especially on the left, by atheromatous changes, fatty, etc.), beginning atheroma of the aorta, though without calcareous plates.

"*Intestines* and *bladder* normal. *Brain* not examined." (Signed) ROBERT ABBE, M.D.

About two years before his last illness, he had an attack of erysipelas, and at that time careful examination revealed no sign of kidney disease.

When first seen on that first day of April, 1876, there were no signs of chest disease, except slight dulness on percussion and the loss of true respiratory murmur over a space about three inches in diameter, over the back part of the middle portion of the right lung. There were no râles nor rhonchi until the night of the fifth, when subcrepitant and crepitant râles appeared exactly in the place where the loss of true respiratory murmur had first been observed. After this they were never absent, but gradually extended until they covered both lungs, becoming firmer and dryer as they grew older.

It would seem that lowered vitality had placed the capillaries of all the organs in a state of paresis and stasis, whence resulted plastic exudations—a general breaking down, in which all the vital organs were sufferers.

CASE VIII.—(Notes and autopsy by Dr. Stedman, of House Staff.)—"M. A. S., seamstress, admitted to St. Luke's Hospital, September 29, 1877. Has been feeling ill since last spring; has had cough; lost flesh and appetite. The patient is not complaining much of her chest, but comes to be treated for intermittent. She had a chill on the morning of admission.

"Oct. 10th.—Has had a chill every other day since admission. Examination of chest to-day shows that the right lung is free in movement in front without râles, but that there are some râles and signs of thickened pleura in the lower part of this side behind. Over the left lung there are plastic exudation râles, both in front and behind. Closer adhesions (fine dry râles) below. Soft râles are heard in the upper part, but they grow harsher downwards.

"Oct. 22d.—Patient has had no chill since the 11th. At nine o'clock this evening was seized with hæmoptysis and died from suffocation before any aid could be given.

"Oct. 24th.—*Autopsy.*—Right lung free from adhesions, except at lower part, behind. Left lung bound to the chest loosely above, more firmly below, both anteriorly and posteriorly. Lung filled with tubercles (caseous concretions), and two newly-formed cavities, one at the apex and the other at the middle of the upper lobe.

"Into this latter the hemorrhage had taken place from an eroded vessel the size of a crow-quill. The bronchial tubes and trachea were filled with blood. The pericardial and pulmonary pleura were firmly adherent."

The points of interest in this case are: 1. That the interpretation of râles as denoting an interpleural pathological process was correct.

2. That caseous deposits in small scattered masses may fill the lung without being detected when loose adhesions shut off sound, and especially when the true respiratory murmur is feeble or absent.

When the adhesions are firm and close, sound is more directly transmitted, and the pathological condition of the lung may be more easily diagnosticated.

3. Fatal hemorrhage nearly always takes place suddenly. A softened caseous deposit opens into a bronchus, and at the same time erodes a blood-vessel of some size, and the cavity and air-passages are immediately filled with blood, and the patient dies as by drowning.

CASE IX.—Pietro Angelo, æt. 29, Italy, sailor, admitted to St. Luke's Hospital May 1, 1877. Had articular rheumatism, for which he was successfully treated with salicylic acid.

June 10th.—Was examined with the expectation of discovering heart lesions, but none were found; but there were signs of a cavity under the clavicle of the left side. Dry, crackling râles were found over the left side, and in the region of the heart there were a few râles synchronous with the heart-beat.

Diagnosis.—Cavity in clavicular region; old adhesions over whole of lung; also adhesions between the left lung and the pericardium. Right lung free. Patient says he has had cough for some time; complains of no pain, and did not think he had any disease of the chest.

June 20th.—Patient has had high temperature for a day or two. Examination shows abundant soft râles in left side, large and small, which have supplanted the dry râles synchronous with the heart's motion.

July 1st.—Patient is losing flesh, and has cough with purulent expectoration. A creaking sound is heard in the region of the heart, synchronous with the movements of the lungs and also with those of the heart.

Aug. 1st.—Patient failing; considerable expectoration, difficult breathing, hectic, and night-sweats.

Sept. 3d.—Patient complains of severe pain in the *right* side, with increased dyspnœa. Examination showed moist, tearing râles with each respiration over *right* lung, the one hitherto healthy. On the left side, in front, a harsh leathery creak is heard, but no râles synchronous with the heart's motion, although it is evidently restrained; behind, low down, there are numerous dry subcrepitant râles.

Sept. 14th.—Died at 5 P.M.

Post-mortem, Sept. 15th, seventeen hours after death. —"Right side of chest: adhesions over whole lung, attaching it to the chest-wall, but soft and easily sepa-

rated by the finger. Left side: the lung is firmly adherent to the chest-wall and also to the *pericardial sac*, and could be separated from them only by dissection. There is a dry tubercular or caseous deposit in upper part of right lung, and a good-sized cavity in upper part of the left."

(Signed) T. L. STEDMAN, M.D.

It will be seen that the soft adhesions easily detached in the right pleural cavity agree in age entirely with the appearance of moist râles of Sept. 3d. The evidence is decisive, for there was no disease of the lung nor of the bronchia to cause râle. The dry harsh râles of the left side also agree in physical conditions (firmly adherent, could only be separated by dissection) in age, with the time they had been under observation. In both sides the age of the adhesions was correctly diagnosticated by the physical signs. Another very interesting fact, and of practical importance, is brought clearly into the light, viz., that of diagnosticating adhesions between the pericardium and the lung, or between the pericardium and the mediastinum, by the sign of râles synchronous with the heart's motion. These signs are not uncommon, and are additional evidence of the interpleural origin of all râles. Cog-wheel respiration is due to adhesions between the lung and the pericardium. If the patient takes a full inspiration, the broncho-respiratory murmur will be interrupted by each beat of the heart during the inspiration, and also during the time while the breath is held. The motion of the heart bringing into sudden tension the adhesions, stops the respiratory sound for an instant at each beat. If the attention is fixed upon the recurrence of these interruptions it will sometimes be possible to analyze this short rhonchus, and to distinctly recognize that it is made up of fine crepitant râles. Occasionally it is heard to the right of the sternum near the cartilage of the sixth rib, and at the diastole of the heart, simulating aortic regurgitant murmur, except that it is not heard to the left of the sternum. In this position its crepitant quality may be very manifest. The adhesions are between the pericardium covering the right auricle and the right lung. When the pericardium is attached to the mediastinum, a systolic murmur of the heart may result. So that interpleural signs falsely interpreted lead to incorrect diagnosis as regards diseases both of the heart and of the lungs. Many other cases are recorded which furnish equally strong proof of the correctness of the views here advocated.

The late Dr. Sprague, of Fordham, at the House of Rest for Consumptives, made about forty autopsies, in which the evidences were conclusive that the localities of râles were the sites of adhesions; that the localities of adhesions, unless so tight as to prevent all motion, were always the sites of râles. Dr. Sprague's eminent ability and painstaking assiduity render his observations of great value. I am fully persuaded that if those having opportunities will note the locality of râles for the purpose of verifying at autopsies the presence of adhesions, it will become impossible to doubt the mechanism of their interpleural production.

What diagnostic interpulmonary signs have we remaining, if all the râles and rhonchi hitherto considered as evidence of pneumonia, bronchitis, capillary bronchitis, œdema of the lung, tuberculosis, cavities, etc., are to be interpreted as of interpleural origin? Need we be anxious about the consistency of Nature? May we not leave all that to her, resting assured that as our knowledge is increased we will become more consistent observers, and see that she is always right? It is all-important for correct diagnosis, and in the treatment and management of disease, that the physical signs should indicate the pathological conditions. The very frequent mistake of treating bronchorrhœa for bronchitis, and ignoring the interpleural pathological cause, until the lung is irretrievably crippled, will be avoided. If we recognize the earliest signs of plastic exudation between the pleuræ we are enabled in all ordinary cases to promote its entire absorption. But if the favorable time is allowed to pass the exuded plastic material becomes organized, and even, if but of limited extent, may be from time to time the focus of renewed exudations, until the whole lung is bound to the chest-wall. Fibrous bands also extending through the pulmonary tissues contract, as they grow older, and finally result in the miserable conditions of fibroid phthisis.

Diseases of the lungs and bronchi are manifested by their own signs, after excluding those which we have demonstrated to be interpleural. In so doing the gain is in greater accuracy in diagnosis, and in greater discrimination in the value of signs. The crepitant râle, although having its mechanism within the pleural cavity, is yet a valuable sign of pneumonia, or of phthisis, as it so often accompanies these diseases; but it is not pathognomonic. It may exist in the absence of both, and either may be present without crepitant râles. Centric disease, without cavities and without interpleural adhesions, is without râles or rhonchi. Yet there is an area of dulness and of absence of true respiratory murmur, exactly agreeing with the locality of the disease, which, with the rational signs of temperature, pulse, and sputa, render its detection sufficiently clear to avoid mistakes in treatment. Depending upon crepitant râles as pathognomonic has many times delayed prompt treatment, and has resulted perhaps in the loss of the patient. Convincing demonstrations alone changed my views as to their intrapulmonary mechanism. In pneumonia the exudation of plastic matter into the connective tissue of the true respiratory system is an early phenomenon. I formerly believed that the stiffened air-sacs, yielding reluctantly to the expansive force of inspiration, must separate the newly-exuded fibrine in the cellular tissue, thus giving rise to multitudinous râles.

Dr. Walshe once proposed the same theory, which has so many plausible facts to support it, but was obliged to modify his opinion, as I have since done mine.

He found that crepitant râles, in some cases, could be proved to be due to the presence of thin fluid in the pleural cavity (Walshe on *Diseases of the Chest*, pp. 107 and 108, 3d edition).

In Dr. Chamberlain's case of atheromatous aorta (reported in the *New York Med. Journal*, Oct., 1874) I had the privilege of making a careful exploration of the patient's chest not long after the first serious symptoms were manifested. Over the lower part of the right lung there was crepitus or fine subcrepitus, and at the autopsy blood was found in the right pleura, but both the pleura and lung were healthy. The signs of bronchitis of greatest diagnostic importance are not râles, but raised temperature, quickened pulse, with harsh and sibilant respiration, which masks true respiratory murmur (it does not supplant it as is done in pneumonia), with appropriate rational signs.

When resolution takes place, then true mucous râles are heard in the upper bronchi, distant from the ear, and at longer or shorter intervals, as it is collected or expectorated. Bronchitis may be complicated with pneumonia or pleuritis, in which case the signs will be more or less blended.

Sympathy between the bronchia and the pleura is very intimate. Severe bronchitis is apt to induce plastic exudation between the pleuræ, and plastic exudation is accompanied more or less with bronchorrhœa. Foreign bodies in the bronchia induce plastic exudation between the pleuræ, even sooner than they do pneumonitis.

Capillary bronchitis may or may not be accompanied by râles; when so, they have their origin within the pleural cavity, and when there is no exudation there are no râles. This is a disease peculiar to children, and is really pneumonitis and has the same signs. That which is generally called capillary bronchitis, on account of the sign of small moist râle, is simply an interpleural plastic exudation, to which children are also very liable.

Fine subcrepitus may or may not accompany pulmonary œdema, but only when there is exudation of some kind within the pleuræ.

The only true sign of pulmonary œdema is dulness under percussion. It is not distinguishable from pleuritic effusion, except when there are fine subcrepitant râles as well, showing that the pleural surfaces are in coaptation and covered with lymph.

The diagnostic signs of interpleural pathological processes may be briefly stated thus: Physical signs —râles or rhonchi; large gurgling, soft tearing, harsh, dry, rattling, crackling, small, fine, creaking. Percussion note: flat, parchment-like, wooden, high pitch, dull. Rational signs: quickened pulse, hurried respiration, dyspnœa, asthma, short hacking cough when the adhesions are over the summit and upper part of the lung; spasmodic and strangling when in the lower pleuræ. Bronchorrhœa, hæmoptysis, irritable stomach, dyspepsia, emaciation, loss of strength, frequent perspirations, especially when sleeping; and lastly, when advanced and extensive, all the signs peculiar to fibroid phthisis.

FRACTURE OF THE EIGHTH DORSAL VERTEBRA.

By EDWARD T. CASWELL, M.D.,

PROVIDENCE, R. I.

The following case possesses some interest, from the long interval of time which elapsed prior to the death of the unfortunate sufferer.

C. P. G., aged 31, resident in New York City, went into a mercantile warehouse in the lower part of the city, to see some pictures which a friend had recently purchased. These were, unfortunately, hung up in the passage-way of the third story, around an open hatch. In an unfortunate moment he stepped backward, and fell through the hatchway, from the third story to the first, striking upon his back. The accident occurred February 7, 1876. He was at once taken to the Reception Hospital in Chambers Street, and from thence he was removed, on the following day, to St. Luke's Hospital. By the kindness of Dr. Stedman, of St. Luke's Hospital, I have the following entry from the hospital record: "An examination showed fracture of the arch of the eighth dorsal vertebra. The patient was completely paralyzed below the eighth rib. He had involuntary evacuations from the bowel, and was unable to pass his water, catheterization being necessitated. He suffered almost continually from priapism." He remained at St. Luke's until March 18th, when he was taken home, and placed in the care of Dr. ——, of New York. In the middle of the following June he was removed to his father's farm, in the vicinity of this city, where I first saw him on the 3d of September. Towards the close of the year he was brought into town, and remained in my charge until his death on the 14th of September, 1877. He thus survived his injury nineteen months and ten days.

When first seen by me there was a marked depression in the region of the eighth dorsal vertebra. There was complete paralysis, both of motion and sensation, in the lower part of the body. The legs, crossing each other, were flexed upon the thighs, and the thighs upon the abdomen, and so firmly were the limbs fixed in this position that it was impossible to move them, and it was with difficulty that the urinal could be used. He was rolled from side to side by taking hold of the knees. There were large red sores over each trochanter, and ulcerations at each point of contact of the anchylosed limbs. He had no control over the movements of the bowel or of the bladder. Urine came away at intervals and in quantity, not by dribbling, and without his knowledge. Whatever pain he suffered was referred to the lower and middle portions of the chest.

Such continued to be his condition, with slight variations, while under my care. As one ulceration would heal, another broke out. That over the right trochanter, however, never healed, and extended to the bone, portions of which were exfoliated. His appetite was variable, and he emaciated gradually and constantly. The alvine discharges were regular, although involuntary. The urine was very variable, at times quite clear, and again turbid. There was in general no difficulty in breathing, and he often said that above his stomach he was as well as ever. His mind was clear and active, as evinced by the fact that within the last six weeks of his life he took out a patent for a new method of churning, all the details of which he had worked out while lying in his helpless condition. There was one feature which became more marked in the latter months of his life, and which has been previously noticed in similar cases. There was a reflex spasmodic contraction of the muscles of the affected limbs, when any effort was made to move them. His constitution, naturally strong, at last gave way, and, after nearly twenty months of suffering, death came to his relief.

At an autopsy made on the night of his death, the only points of interest, aside from the fracture, were the extreme emaciation of the body, which was nothing but a skeleton covered with skin, the existence of an amyloid liver weighing eight pounds, and the presence of a large abscess in the anterior wall of the abdomen, low down over the bladder. The abscess had caused no pain, and its presence had not been suspected. The position of the lower limbs would have almost prevented an examination, even if my attention had been turned to it. An examination of the fractured vertebra showed fracture of the body of the eighth dorsal vertebra, and of the left lamella and transverse process. Dr. J. B. S. Jackson, of Boston, to whom the specimen was submitted, states that the intervertebral substance was torn through, except along the anterior edge, where it is more fibrous and resistant; there the upper edge was broken off, and all around the anterior half, and in close connection with the above, it was carried forward and downward.

The patient lived for a year and a half, and yet the spinal canal was so obstructed by the displacement, that a probe could scarcely be passed through.* The

* Boston Med. and Surg. Journal, vol. lxxxvii., No. 25, p. 716.

specimen has been placed in Dr. Jackson's collection, and in looking at it one cannot fail to be amazed at the tenacity of life which was exemplified in this case.

January 28, 1878.

CONGENITAL DEFORMITY OF LOWER EXTREMITY.

REPORTED BY GEORGE E. POST, M.D.,

PROFESSOR OF SURGERY IN SYRIAN PROTESTANT COLLEGE, BEIRÛT, SYRIA.

WARDIN, aged eight months, was brought by her mother to the clinique of the hospital, presenting the appearance delineated in the accompanying wood-cut. The left lower extremity was two inches shorter

than the thigh of its fellow, and presented the appearance of a fleshy protuberance, from the lower and anterior portion of which the foot protruded with the sole directed forward, as seen in the cut. On examination, the motions of the hip and knee were recognized, though limited by the bent positions of the bones. The thigh was bent at nearly a right angle, projecting forward, thus throwing the knee relatively backward, and with it the upper part of the tibia and fibula, which have thus come to be parallel with the nates. The tibia and fibula are bent forward at a right angle, so that the sole of the foot is thrown forward; thus the bones of the extremity are folded on each other like the wing-bones of a bird. The upper part of the thigh is directed nearly horizontally forward, and the lower part nearly horizontally backward. The knee, being slightly flexed, gives the upper part of the tibia and fibula a horizontal position, projecting backward. The bend forward at their middle completes the zigzag of the organ, and presents a type of deformity difficult to explain. Neither mother nor child have any strumous appearance, and the mother is not aware of any violence occurring during her pregnancy which would explain an intra-uterine fracture with resulting deformity. The child being too young to be weaned, and the mother unable to remain at present in the hospital, no operation was undertaken. It is proposed, when the child shall have been weaned, to perform subcutaneous osteotomy, with a view of straightening the extremity and securing a limb on which an artificial member can be advantageously adjusted.

Dec. 20, 1877.

DR. SEVERIN GALEZOWSKI, formerly professor in the Polish University of Wilna, died in Paris on March 31st, at the age of 77 years. He was the uncle of Dr. Xavier Galezowski.

Progress of Medical Science.

STRUCTURAL CHANGES OF THE SYMPATHETIC NERVE IN DIABETES.—During the past year Dr. Poniklo, of the University of Cracow, had the opportunity of making five post-mortem examinations of patients dying of diabetes. Attention was directed to the sympathetic, and the whole tract of this nerve was excised in each case, and submitted to a careful examination. The following were the results obtained:

1. In all the cases an increased amount of connective tissue in the ganglia was found, especially in the upper and lower cervical. This change consisted partly in an hypertrophy of the connective stroma occurring in the sympathetic ganglia, and partly in the accumulation of newly-formed connective tissue between the nervous elements, a change that was beautifully seen in transverse sections of the ganglia. In some sections the amount of connective tissue was very great and only rudiments of nervous tissue could be detected. The capsules of the nerve-cells appeared to be thickened, having numerous granules adhering to them. In some parts numerous cells, partly round, partly fusiform or elongated, were deposited between the fibres of connective tissue, this cellular infiltration being most marked around the blood-vessels.

2. In one case abnormal dilatation of blood-vessels in the solar ganglion was found, the vessels being tortuous and distended with corpuscles. In some of the microscopical preparations, the dilated vessels covered nearly one-half the field. There were also irregular accumulations of red corpuscles in the outer spaces between the nervous elements, the result of small hemorrhages.

3. The most interesting change was that presented by the nervous elements themselves. The nerve-cells, the capsules of which were thickened as above described, appeared to be of smaller size than normal; their protoplasm was more homogeneous, especially in those parts of the ganglion where the cellular infiltration predominated. In one case, that of a young subject, there was an increased amount of dark yellow or brown granular pigment in the nerve-cells. Turning now to the nerve-fibres, it may be mentioned that, in the normal ganglia of the sympathetic, in addition to the bundles of gray non-medullated fibres, there occur a fairly large number of *white medullated* fibres, arranged partly in separate bundles enclosed within a distinct sheath of areolar tissue, and partly intermixed in the bundles of the non-medullated fibres. No bundles of medullated fibres were found in the sections of ganglia from these cases of diabetes; but here and there isolated and extremely atrophied white fibres could be distinguished in the midst of the gray, which were well preserved in the preparations. These last-named fasciculi were even much atrophied, the bundles being small, and the individual fibres wasted, and in parts almost concealed by cellular infiltration. The changes in the connective stroma of the ganglia above described sufficiently account for the atrophy of the nerve-fibres and cells, an effect very frequently observed in the other parts of the nervous system—*e. g.*, the brain and spinal cord—where there is hypertrophy of the connective tissue. It must, however, be reserved for future investigation to ascertain whether this atrophy of the nerve-fibres does not extend higher up in a centripetal direction.

The above-mentioned changes were met with, to a more or less extent, in each of the five cases examined, and they presented an excellent illustration of extreme-

ly advanced degeneration of the cervical sympathetic ganglia. The results of this examination of the sympathetic nerve in diabetes, although based on a small number of cases, are in perfect accordance with physiological experimentation, for Cyon and Aladoff have shown that excision of the cervical ganglia is immediately followed by diabetes. So extensive a degeneration of the ganglia as that above described may be considered as equivalent to their excision.—*The Lancet*, February 23, 1878.

Glycerine in the Treatment of Internal Hæmorrhoids.—As an additional contribution to the therapeutic value of glycerine in the treatment of internal hæmorrhoids, comes the report of Mr. George B. Powell, who has used it in four cases with very gratifying results. In the first two cases cures were effected, and in the others great relief afforded. Its action on the rectum he considers to be of a specific nature, but is unable to explain its *modus operandi*. In the hæmorrhoids of drunkards he believes it will be found perfectly reliable and effective; and administered with citric acid and tinc. cardam co., it forms a pleasant and agreeable mixture.—*The Practitioner*, April, 1878.

Objections to the Use of Carbolic Acid in the Treatment of Piles.—In a paper read before the Kentucky State Medical Society, Dr. Mathews, of Louisville, urges the following objections to the use of carbolic acid in the treatment of piles:

1. It is just as painful as the ligature. 2. It is insufficient. 3. Death is to be feared: (*a*) From peritonitis; (*b*) from embolism; (*c*) from pyæmia. Mr. Allingham, of London, has used the acid in six cases with very unsatisfactory results, and he considers the ligature the most efficient remedy we have. Three cases are cited in which *very violent inflammation* followed the use of the acid, and this coincides with Dr. Mathews' personal experience in many cases. It can only be cured by a process of *inflammation*, *suppuration*, and *sloughing*, and this once started is immediately beyond our control. Without any prescribed rule as to the graduation of the dose, we would be liable to excite too little inflammation and thus fail to cure, or too much and endanger.

Peritonitis may be excited by extension of the inflammation, or by gangrene and perforation of the bowel. Embolism may occur from the detaching of a portion of coagulum, and, owing to the comparatively slow coagulative power of the acid, this is very liable to occur. Death from pyæmia is more likely to occur with this treatment than after the use of the ligature.—*American Medical Biweekly*, April 27, 1878.

Treatment of Vomiting in Pregnancy.—Dr. M. O. Jones, of Chicago, believing that the vomiting of pregnancy is a reflex phenomenon depending on the condition of the uterus, argues that it can be best controlled by local treatment at the seat of irritation. To accomplish this he proposes to excite a superficial inflammation of the os and cervix uteri, hoping by this means to concentrate the nervous phenomena at the point of irritation, and thus save the stomach. He had the opportunity of testing this theory in five cases, in which he cauterized the cervix with the solid nitrate of silver, with surprisingly successful results. These were all extreme cases, in which the ordinary remedies had been faithfully tried, without any benefit whatever in two of them, and with but temporary improvement in the others. Four were cases of first pregnancy; in two there was slight erosion of the mucous lining around the os; the other three were perfectly healthy. In addition to these, Dr. J. Marion Sims reports a case in his practice, in which most brilliant results were obtained by this treatment. The night after the application of the silver the patient had the first night's rest she had had for a week, and the next morning ate a liberal breakfast, something she had not done for a fortnight.—*Richmond and Louisville Medical Journal*, April, 1878.

Diagnostic Signification of the Retardation of the Carotid Impulse.—Doctors Bozzolo and Fiori have made a series of experiments to ascertain the truth of Dr. Trippier's recent assertion that the carotid impulse is retarded only in insufficiency of the aortic valves. In these experiments they used the graphic method, placing a Buisson's tympanum over the apex of the heart, and another on the carotid; both of these made their tracings on a cylinder moved by clock-work with Faucault's regulator. The observations were made on patients having various kinds of functional diseases of the heart, on healthy youths, a young boy, on old people in a good condition of health, but presenting, in addition, a manifest degree of general arterial atheroma. The result of the fifteen observations was as follows: A retardation equal to or greater than that observed in aortic insufficiency occurred in healthy individuals and in patients with cardiac diseases of different natures. There are cases of aortic insufficiency which present much less retardation than that presented by healthy individuals. Hence, Trippier's assertion is not justified, and the retardation of the carotid impulse cannot be considered as a pathognomonic sign of insufficiency of the aortic valves.—*Lo Sperimentale*, March, 1878.

Changes in the Sympathetic Nerve from Pseudo-Muscular Hypertrophy.—Dr. Vincenzo Brigidi communicates (*L'Imparziale*, February, 1878) a case of pseudo-muscular hypertrophy, which is rendered particularly interesting by the discovery, for the first time in this disease, of traces of alterations in the sympathetic nerve.

The patient, a male, thirty years of age, had presented all the signs of the disease, and died of a pulmonary affection. At the autopsy, the voluntary muscles were found to present the changes described by Duchenne—fine capillary injection, hyperplasia of the connective tissue, great quantity of adipose tissue, etc. The peripheral nerves were normal; the cerebrum, pons varolii, medulla oblongata, and spinal cord presented no changes visible to the naked eye. A careful examination of the sympathetic revealed the following: The several ganglia appeared in general normal, though more than usually colored, especially the cervical.

Several of these, together with the cæliac and other adjacent small ganglia, were examined under the microscope. They presented a notable dilatation of the peripheral and central veins; the larger arteries were empty and not dilated. The nerve-cells were less numerous than usual; those situated adjacent to the vessels appeared more or less atrophied and contained pigment granulations of a yellowish red, darker, and even black color. The connective tissue appeared hyperplastic, and at certain points to the extent of true sclerosis. With regard to the nerve-fibres, those containing myeline were rare and manifestly diminished in size, while the fibres of Remak were distinctly diseased, and perhaps in some places were replaced by connective tissue. The author says he makes no pretensions to having demonstrated the pathogenesis of this disease, but is inclined to concur with Duchenne in referring it to a lesion of the vasomotor nerves.—*Lo Sperimentale*, March, 1878.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, May 25, 1878.

THE HYDROPHOBIA QUESTION.

DURING the last five years, the medical and lay journals in England and on the continent have been teeming with histories of cases of hydrophobia, and with various views concerning the pathology of this dire malady. In view of the interest which the subject has lately excited in our own community, both among our professional brethren and among the laity, we trust that our readers will not consider the following résumé of the present state of the question inopportune.

We will premise with the assumption, even though it is opposed to the views of so distinguished a pathologist and clinical observer as Mr. Bergh, that hydrophobia does really exist as a distinct affection. The practically unanimous conviction of the medical profession relieves us from the necessity of discussing this point. None but a fanatic, blinded by preconceived theories, can doubt the existence of the disease. We start, then, with the assumption that hydrophobia is an acute, infectious disease, communicated to man from a rabid animal, usually the dog or the cat.

At the very starting-point, however, of our consideration of the question, we are met with a very interesting and important problem, "Can the bite of a healthy dog produce hydrophobia in the human being?" The weight of testimony, in our opinion, decidedly negatives this assumption. Putegnat, an active advocate of this doctrine, mentions a case coming under his own observation in which a child, after having been bitten by a dog, became affected with true hydrophobia (lyssa humana). The offending dog, however, remained well for six months afterwards, at the end of which period it was accidentally killed. Many cases of a similar nature might be quoted from the abundant literature of the subject, but this one will suffice to show the general drift of the argument. But there is a fatal objection, to our minds, which can be advanced against this as well as all other similar cases. According to Bollinger and Fleming, the period of incubation in the dog may extend to eight months. May not the animals in question have been in the incubation stage of the disease, at the time that their bites were attended with such fatal results? Thamhayn, who wrote as far back as 1859, has collected the histories of eighteen cases, in which hydrophobia was produced in the human subject from the bites of dogs in the incubation stage of rabies.

Another question of still greater practical importance is that of the spontaneous origin of the disease in the lower animals. Is rabies generated in the dog *de novo* in consequence of exposure to extremes of heat and cold, ungratified sexual excitement, maltreatment, insufficient food, etc., or is it only produced by inoculation with the virus of another rabietic animal? On this question, again, we are assailed by adverse statements. All analogy protests against this doctrine. There is no infectious disease in the nosology which the most advanced pathologists consider capable of being generated *de novo*. Furthermore, it is entirely beyond our powers of conception that a specific disease should be produced otherwise than by inoculation with an equally specific virus. But, opposed to these theoretical considerations, are the positive statements of numerous authorities in veterinary medicine.

Fleming, one of the most distinguished living veterinary surgeons, although formerly opposed to the doctrine of the generation of the disease *de novo*, is now a strong advocate of it. Roucher, another eminent authority, adduces the following case as proof of spontaneous origin induced by solitary confinement: a pug dog, while apparently well, was kept tied up in a cellar for fifteen to twenty days; at the end of this time he became rabid and bit his mistress, who soon after developed hydrophobia. In this case it is more than probable that the animal was infected previous to his confinement. An oft-quoted case of spontaneous rabies is that of M. Leblanc. The animal, a cross-bred spaniel nearly six months old, had never left its mother, nor gone away from its home. When the mother became in rut, the young dog was roused to a state of intense venereal excitement by the odor of the menstrual discharge, and became very irritable and savage in his disposition. A few days later the animal attacked an attendant, whereupon the dog was taken to M. Leblanc, who diagnosed rabies; five days later the dog died. But M. Decroix, after an inquiry into the facts of this case, announces that M. Leblanc had not been told the correct version, and thus invalidates it as an argument for the spontaneous generation theory. It is quite certain that most of the so-called spontaneous cases would prove as unreliable as the above-mentioned ones, if a careful and painstaking examination were made into

the particulars of each. This is, of course, difficult of performance in very many instances. Even the advocates of this doctrine admit it to be of rare occurrence. Among its supporters, however, are such veterinary authorities as Bouley, Roucher, Fleming, Lindsay, and Brueckmueller. But with the adverse testimony of the best medical pathologists who have investigated the subject (Magendie, Dupuytren, Breschet, Gull, Bollinger, Virchow) we think that, until more positive and conclusive evidence is offered, we are justified in asserting that rabies does not originate in the dog other than by inoculation with the virus of a rabietic animal.

When we turn to the pathological anatomy of this disease, we find ourselves again involved in a mass of contradictions. We shall chiefly consider, in this connection, the lesions discovered in the central nervous system, since these have, almost exclusively, been the subject of investigation by pathologists. As long ago as 1850, Drs. Sidey and Bennet made a careful microscopical examination of the brain and spinal cord with entirely negative results.

Bastian made an autopsic examination in 1866, paying especial attention to the specific gravity of the brain. He found the brain congested and the pia mater adherent; the specific gravity of the gray matter of the convolutions was markedly increased above the normal; there was no change in this respect in the basal ganglia or in the medulla oblongata.

Meynert, in 1869, made two investigations with the following results: The blood-vessels of the cord were distended and their walls were undergoing amyloid degeneration in spots. There was some cell-proliferation in the adventitia, with traces of colloid masses in the perivascular sheaths. Meynert thinks these appearances were due to œdema consequent on excessive congestion.

Allbutt reported two cases, in 1872, in which the following lesions of the medulla were noted: Great vascular congestion; thickening and incipient nuclear proliferation scattered here and there in the walls of the vessels; in many places, a highly refracting material outside the vessels, probably coagulated fibrinous exudation; a slight grade of granular degeneration in the nerve-cells of the convolutions and of the medulla oblongata.

In June, 1874, Benedict found the following lesions in two cases: In the convolutions of the brain were miliary depots of small, round cells arranged in clusters around the vessels; in the neighborhood of the vessels, there were transitions from the red blood-globules to pigment granules and masses; there were, also, hyaloid masses outside of the vessels probably originating from blood-globules. Benedikt considered the lesions indicative of a hemorrhagic cerebritis.

In July, 1874, Dr. Hammond published a case in which fatty degeneration of the nerve-cells in the cerebral convolutions and in the nuclei of origin of the pneumogastric, hypoglossal, and spinal accessory nerves was the principal lesion. The extremely imperfect method employed for the preservation of the nervous tissue in this case, however, renders the results of the examination practically valueless.

Leyden made a post-mortem examination, in 1875, with entirely negative results.

In 1876 Freidrich Schultze made one microscopic examination, and, with the exception of vascular congestion, found the nerve structures entirely normal. This observer considers the appearances in Benedikt's cases as chiefly due to changes brought about by long-continued preservation in Mueller's fluid.

Wassilieff, likewise, found congestion of the vessels; in some places, the nerve-cells of the medulla oblongata were cloudy; there was an aggregation of cells, and hyaloid substance in the perivascular spaces.

In February, 1877, Dr. Coats investigated a case which presented the following lesions: An accumulation of round cells in the perivascular spaces, especially in the upper part of the cord, medulla oblongata, and pons varolii, and, to a minor degree, in the convolutions; there were similar accumulations of round cells in the spaces around the ganglion-cells.

Dr. Gowers submitted the results of four examinations to the London Pathological Society, in May, 1877. In one case, the only lesion discoverable was congestion of the vessels. In two of the other cases there were thrombi, probably ante-mortem, in the larger blood-vessels.

In three cases there was a collection of cells in the perivascular sheaths and miliary abscesses in and around the hypoglossal nuclei; the nerve-cells were somewhat swollen and granular, especially around the hypoglossal, pneumogastric, and glosso-pharyngeal nuclei of origin.

It is very evident from a review of the investigations we have quoted above, that there is no lesion of the nervous system peculiar to hydrophobia. In some cases nothing abnormal was found except congestion of the vessels; the remaining lesions are probably in great part due to the continuance of this congestion.

The lesions are not, at least, a specific effect of the hydrophobic virus, since similar conditions are found in other diseased processes, notably in progressive paralysis of the insane and in chorea. There is very little doubt that, until our processes of investigation are more refined and accurate than they are at present, the microscopical examination of the central nervous system will do very little towards clearing up the pathology of the affection.

In 1843 Prof. Ragsky made a chemical examination of the blood of a hydrophobic patient with the following results: The reaction was neutral; in 1,000 parts were contained 769.6 water; 133.0 hæmatoglo-

bulin; 80.2 albumen; 12.4 extractive matters and salts; and 4.8 fibrin.

It appears to us that this line of inquiry, with the improved methods now at our command, promises more fruitful results than microscopical examination of the nervous system. The chemical and microscopical examination of the saliva of the rabid animal has been hitherto sorely neglected, and in this direction, perhaps, lies the key to the whole morbid process.

The treatment of the affection may be dismissed in a very few words. According to the report of the French Minister of the Interior, there has not been a single well-authenticated case of recovery out of one hundred and fifty cases of hydrophobia which have occurred in France within the last twenty-five years. We are forced to the sad conclusion that, with the present means at our command, every case of hydrophobia is necessarily fatal. A reported cure is always open to the suspicion of an error in diagnosis. Until further research gives us a better clue to the pathology of the affection than we now possess, we can hope to effect very little in the treatment of the disease except by the grossest empiricism.

Let us turn from this humiliating topic to the more promising one of prophylaxis. In the first place, what should be done in case a man is bitten by an animal suspected of being rabid? Without doubt, the best practice is to excise the wounded part immediately with an unsparing hand. Dr. Fayrer recommends placing a piece of wood in the wound and then cutting around and beneath it. Sir William Gull and Dr. Fayrer believe that the virus remains localized, for a time, in the cicatrix and think that cutting out the cicatrix, even after the original wound has healed, may serve to avert the disease.

The final question which we shall consider is, "What measures shall we adopt to diminish the production of rabies in the dog?" Some authorities advise that all dogs should be secluded for a certain period, ranging from six to eight months, and that thus the disease would naturally die out of itself. But they forget, that even if this plan were practicable, the dogs might be again inoculated by the virus of some of the other domestic animals. The following measures have been recommended by Mr. Fleming, and appear to us to be entirely practicable:

1. All vagrant dogs should be killed.

2. Dogs should not be muzzled except in times when the disease is epidemic.

3. They should be placed under good hygienic conditions (food, drink, cleanliness, etc.).

4. The number of useless dogs should be diminished as much as possible by imposing a heavy tax upon every animal.

5. The owner of every dog which is acting in a suspicious manner should be compelled, under penalty of criminal punishment, to report the case to the police.

THE RELATIONS OF SYPHILIS TO PUBLIC HEALTH.

Dr. Frederick R. Sturgis, of this city, has published a pamphlet upon the above subject, and opens afresh a discussion in which every medical man is interested. Although he confines himself for the most part to those phases of the question which relate rather to medical practice than directly to public policy, his remarks are extremely suggestive, and the facts which he presents are very significant. The first of these refers to the common occurrence of syphilis. In regard to this point we observe with regret, that although statistics have been collected from some of the largest cities of the old and new world, the author has been baffled in his attempt to gather sufficient official and reliable data to offer a definite reply to the question. This may be gathered by his own conclusions, as follows: "Syphilis is *probably* widely spread, and *possibly* increasing in extent," but "this opinion, from the imperfect means at our disposal, must, for the present at least, remain more or less conjectural."

It is important to notice the apologetic and doubtful nature of the response, from one who has clearly devoted great energy and perseverance to arrive at the truth. Dr. Sturgis admits that he has failed in his attempt to collect the necessary statistics, and had to rely upon the records of hospitals and other medical institutions where the treatment is gratuitous, and the official returns of the army and navy; but this takes no cognizance of private cases, a considerable element in arriving at a final result. He has, however, skilfully drawn upon his own resources to remedy the difficulty. Taking New York, he finds that, for the year 1873, 250,536 persons received gratuitous medical aid. The venereal cases were 12,841, and of these 5,045 were syphilitic. Then taking the statistics for the mercantile marine, he found the percentage of venereal to total number of cases ranged from 16 to 24 per cent. Call it, he says, as an average 20. That is five times as much as he gives the percentage for New York venereal poor. In the same report he found that the percentage of syphilis to the total number of sick was over 16, that was about ten times as much as his estimate, leaving nine-tenths to be accounted for. If we adopt this view we have a total of 49,364 persons treated privately for venereal diseases in New York, of which 45,405 would be syphilitic. In other words, out of a population of 942,292 persons, 61,705 would be suffering from venereal diseases in some form, and of these 50,450 would be due to syphilis. In London an official report, which covers one week's medical relief at hospitals, dispensaries and workhouses, supports the view that during the year (1868), 7 per cent., or about one in fourteen, of the applicants were afflicted with venereal disease. Considerable interest is attached to the returns of Paris, where stringent sanitary regulations are in force to combat this form of disease, and we are surprised

to find a total of 48,980 cases—a formidable array, when it is confessed that the actual amount is really much higher. These figures confirm us in our views, previously expressed in the RECORD, that little reliance can be placed on any system of surveillance which is not more radical and thorough than has yet been devised.

The second point raised by Dr. Sturgis is, "Can syphilis be considered a disease fatal to life?" On this question of fatality Dr. Sturgis answers in the *negative*, so far as the acquired form goes; "but its excessive mortality in the congenital variety renders it serious and alarming."

In our opinion this question of the fatality of syphilis can barely be considered alone, as the issue involves the discussion of a secondary point, which Dr. Sturgis reserves for a distinct examination, and really forms his third problem, which is, "Does *it* favor the development or fatally influence the cause of other disease?"

We apprehend these two questions are inseparable, and that we must arrive at a decision on the latter before a logical and definite reply can be given to the former. It is true that the path of Dr. Sturgis to his final results is considerably shortened by his belief that "acquired syphilis is comparatively harmless in its influence over the course and development of other diseases;" and as he decisively puts it, "Syphilis can only produce syphilis." This opinion we receive with respect, but it is difficult to ignore esteemed authorities who have shown that the future of the syphilitic patient is far from assured.

Scrofula and cancer *may* not owe their origin to syphilis, but very many other diseases of equal importance nevertheless do. It is but the too common experience of the hospital surgeon to find his attention drawn to varied instances of the lingering virulence of the syphilitic poison, and the reports of operations for morbid growths and diseased joints or bones usually open with a reference to the previous record of the patient in regard to syphilitic taint. Thus, while we admit that the majority of patients survive the first attack of syphilis, it appears difficult to pronounce upon the issue of a disease that is oftener relieved than radically cured. The relieved syphilitic patient may leave the hospital apparently recovered and never return to its walls, but who would guarantee his future? In these remarks we have followed the plan of Dr. Sturgis, and refer to syphilis *proper* when we speak of that disease.

This subject is, of course, too wide to be followed out in detail within the present compass, and we appreciate the difficulty Dr. Sturgis must have encountered in condensing within the limits of a small pamphlet matter that might have formed material for a volume.

ALEXANDER VOLTA.—On April 28th, the statue of this celebrated physician was unveiled in the University of Pavia.

Reports of Societies.

NEW YORK ACADEMY OF MEDICINE.

SECTION OF THEORY AND PRACTICE OF MEDICINE.

Stated Meeting, April 16, 1878.

DR. E. F. WARD, CHAIRMAN.

THE INFANTILE DIARRHŒA OF SUMMER.

DR. J. LEWIS SMITH was announced to read a paper on the above subject, but apologized for not having written one, and made the following remarks:

This summer diarrhœa, as an epidemic, he said, is confined to the cities, being scarcely at all known in the country. In New York it makes its appearance about the middle of May, or earlier, if the season is unusually warm. From that time the cases increase in number and severity until the maximum heat of the year is reached, during July and August. After the latter month it begins to decline, and it at length ceases to be an epidemic about the first of November. Its prevalence and severity is found to correspond with the degree of heat; yet hot weather is not the main cause of it. In the rural districts the temperature may be just as high as in the city, but this summer diarrhœa does not occur as an epidemic there. It is, therefore, pre-eminently a disease of cities, and we must look for some other source for it than simple high temperature. Undoubtedly one of the most important causes is to be found in the very free exhalations arising from decomposing animal and vegetable matter during the heated term; and the disease is always most frequently met with in those localities where the accumulation of filth is the greatest. Dr. Smith stated that some years ago, while making an inspection of certain portions of New York for the Citizens' Association, he had become fully satisfied in regard to this point. He remembered one block of tenement-houses particularly, in which there was little or no drainage, and the noxious exhalations were peculiarly abundant and offensive; and here there was scarcely a young child in the whole block that escaped the affection. Of course, we do not know exactly in what way these noxious exhalations, due to the effect of intense solar heat upon filthy streets and domiciles, produce the results noted.

But such atmospheric conditions are not the only source of the trouble. Another very potent cause is found in the diet given to children in our cities. Hence it is that mothers are always so anxious about their infants during their second summer, and it is well known that bottle-fed children are far more severely affected than those which are not. Indeed, it is very rare that an infant under six months, which is artificially nourished, escapes the disease in the city during July and August. The two main causes may be set down, then, as atmospheric and dietetic.

Dr. Smith then went on to speak of the pathology of the disease, making the preliminary remark that he thought he had had as good opportunities for observation in this connection as any one in this country. In looking over his notes he found that he had the records of over eighty autopsies, all made in warm weather, during the prevalence of the epidemic. There could be no doubt, he said, that it is essentially an inflammatory disease, especially after it has continued a short time. For the first few days there

may be no evidence of inflammatory action; but at the end of a week or so, lesions of this character are well marked in the intestines, and particularly the colon. Ordinarily, the surface of the stomach is quite pale, and consequently presenting no indications of gastritis. Yet, notwithstanding this fact, vomiting is a very frequent symptom of the disorder. Occasionally there is some hyperæmia of the stomach (more frequently observed in infants of about three months than any others), but, as a general rule, it is entirely absent. The duodenum also generally presents no lesions. On entering the jejunum, however, we find vascular streaks and patches, and these are still more marked in the ileum. The ileo-cæcal valve is frequently the seat of severe inflammation, and sometimes it is materially thickened. In the large intestine the evidences of inflammatory action are yet more prominent, and there is apt to be a vascular and tumefied state of the entire mucous membrane. The sigmoid flexure is usually the most profoundly affected of all, and this seems to be due, in great part, to the irritation produced by food, which remains longer in contact with it than with the other parts. At the same time we find, along the whole course of the large intestine, the solitary glands or follicles standing out prominently.

In the more protracted cases additional lesions are observed, such as ulcerations, which are more marked in the descending colon, and correspond in position with the follicles, in which the inflammatory action has thus gone on to the point of ulceration. Besides the intestinal lesions there are still others which are more properly complications. As long as the disease lasts, there is always progressive wasting of the whole body. In this some wasting of the brain is involved, and therefore, after the disease has continued for some time, we are very apt to have developed that condition of the encephalon which Marshall Hall and Gooch denominated spurious hydrocephalus. These physicians thought that it was not accompanied by any pathological changes, but late observers have shown that this is not really the case. Its occurrence is noted by the drowsiness of the child, the rolling of the head about, and the depression of the anterior fontanelle, the latter being an important point in the diagnosis between this condition and meningitis. It is characterized by passive congestion, capillary and venous, and also of the sinuses, and transudation of serum sufficient to make up for the wasting of the brain. When the cranial cavity is opened at the autopsy, one or two ounces of this serum sometimes escape. Spurious meningitis is a better name than spurious hydrocephalus for this hydrocephaloid disease in connection with entero-colitis; and it is rarely or never met with except when associated with, or resulting from, the latter affection.

Another complication not infrequently seen is congestion of the posterior portions of the lungs. Where the child's strength has become greatly reduced, the heart also grows feeble, and, in consequence, hypostatic congestion results in the lungs. As such patients usually lie on the back, the posterior part of the lungs is the most dependent, and this hyperæmia, extending for a depth of almost half an inch, is seen at the autopsy all over the posterior portion of both lungs. It is this, doubtless, which gives rise to the dry, hacking cough met with in a large number of such children. If the patient survives long enough, hypostatic pneumonia is apt to ensue, and this is frequently noticed in post-mortem examinations. In such instances it is sometimes possible to inflate the lungs, and sometimes it is not. The above are the most important anatomical characters of entero-colitis.

The symptoms of the disease are sufficiently familiar to all. In the majority of cases it begins very gradually, and the mother is exceedingly apt to attribute the looseness of the bowels to dentition. The child may have six, eight, or ten passages a day, and yet nothing whatever is done to check the diarrhœa, because it is supposed to be salutary during dentition. Dr. Smith said that even physicians formerly coincided in this opinion; but he himself believed that dentition had very little to do with the causation of summer diarrhœa. Indeed, the younger the child, the more apt is it to be attacked; so that infants are more likely to have the disease before dentition than they are after this has commenced.

Vomiting in such cases is not one of the initial symptoms, but sometimes it is, as when, for instance, the attack is directly attributable to some indigestible article of food. In such a case there is both vomiting and purging from the commencement. Ordinarily, however, there is gradually increasing diarrhœa for one or two weeks, and then vomiting also sets in. The most severe form of the disease is that known as cholera infantum, which resembles Asiatic cholera very markedly in its symptoms, but has, of course, no connection with that affection. Cholera infantum is to be regarded as simply an aggravated form of entero-colitis, because it is undoubtedly inflammatory in its nature. To look at or feel the skin of a child suffering from it, one could scarcely think that there was much fever present, and yet the thermometer in such cases almost always shows a temperature of 105, 106, or even 107 degrees. Cases of cholera infantum frequently run on into ordinary entero-colitis, when the urgent symptoms are relieved, and so, on the other hand, cases of ordinary entero-colitis are sometimes charged to cholera infantum, in consequence of some imprudence of diet or other source of aggravation.

The stools vary greatly in character, sometimes being yellowish, sometimes brown, and sometimes green; and there is one point of interest in connection with the green color frequently observed. Formerly it was supposed that this resulted from the liver being at fault, and calomel was almost always administered freely in consequence. Dr. Smith states that for years he had not given a particle of calomel in such cases, though sometimes he met in consultation physicians who thought it indicated from the vitiated condition of the bile, as they inferred simply from the green-colored stool. In order to determine this matter satisfactorily, Dr. Smith some time ago made a special examination of the liver in thirty or forty cases where death resulted from entero-colitis, and not in a single one of them could anything abnormal be detected about it, either with the microscope or otherwise. Moreover, he never observed this green discoloration at the point where the bile is poured out into the intestine (as would naturally be expected if it were due to the action of the latter); nor did it make its appearance until he got down to the ileum, several feet below that point. He concluded, therefore, that the bile had nothing to do with the green color observed. It is well known, also, that the stools may present a yellowish appearance when passed, but become green on standing, and especially if in contact with urine. The green color seems in reality to be due (as, indeed, is now generally accepted) simply to acidity. It is a fact that the kidneys are more apt to be affected in entero-colitis than the liver; and Dr. Smith thought it highly probable that the persistent vomiting in some cases was attributable to uræmia, in consequence of trouble in the kidneys.

Dr. Smith now proceeded to take up the subject of

treatment, which, he said, was one of the greatest importance to every general practitioner. He believed that there were but very few remedies from which it was necessary to select, and for his own part he scarcely ever employed more than two, viz.: opium and bismuth, before the hydrocephaloid stage was reached, and these he considered better than all others. The administration of the large doses of bismuth now employed is of but recent origin, but has been followed by the best results. In ordinary cases it should be given in doses of ten or twelve grains, and it may be advantageously combined with the compound powder of chalk with opium (which contains one grain of opium in forty), or else with ordinary Dover's powder. For general use, however, it is perhaps better to give the bismuth in suspension, and the following prescription will be found a very admirable one:

℞. Tinct. opii deodoratæ .....gtt. xvj.
Bismuth. subnitratis..... ʒ ij.
Syrupi..... ....f ʒ ss.
Aquæ .....f ʒ iss.
M.
Dose, a teaspoonful for a child of one year.

Dr. Smith said that he had been much more successful since he had employed opium and bismuth in this way than before, when he would often try a long list of remedies in succession, and not find good results from any. Such a combination as the above is retained on the stomach, and has the effect of both an antiseptic and an astringent. No preparatory treatment is necessary, unless it is found that some irritating article of food has been taken; but most of the cases are considerably advanced when the physician is called in, and any such source of trouble has long since been gotten rid of.

Almost all cases of entero-colitis need stimulus, and brandy is the best form in which it can be given. Of course, the amount should vary according to the age, and Dr. Smith is in the habit of giving three drops for every month of the child's age (when under one year) every two or three hours.

When the hydrocephaloid stage of the disease is reached, the opium should be withdrawn or given very cautiously; but the bismuth may be continued as before. At this period, however, we must depend principally on tonics and astringents, and one of the most useful agents that can be employed is the liquor ferri nitratis. The following prescription will prove of great service:

℞. Tinct. calumbæ..... f ʒ ij.
Liq. ferri nitratis..... gtt. xviij.
Syrupi ..... f ʒ ij.
M.
Dose, a teaspoonful.

At the same time the stimulus should be kept up as before.

Finally, the kind of diet used is of the utmost importance. If the child is under one year old it should at once be removed to the country, or a wet-nurse should be provided for it, as no artificial food is reliable. If both of these are impossible, the best cow's milk should be prepared in such a way as to resemble healthy human milk as much as possible. The milk should be allowed to stand for some time, and then only the upper third of it employed. In this way the larger part of the sugar and butter will be obtained, while the indigestible casein (which settles to the bottom) will be avoided. As regards farinaceous preparations for children under six months old, Dr. Smith prefers Mellin's Liebig's food, which also has the endorsement of such authorities as Eustace Smith and Tanner. Its taste is quite sweet from the dextrine and glucose which it contains, while it is almost entirely free from starch. When added to cow's milk, it makes as good a substitute for mother's milk as has as yet been obtained. After the age of six months infants can digest a certain amount of starchy food, and then Robinson's prepared barley may be used with advantage, if it is sufficiently boiled. As a rule, however, Dr. Smith prefers Ridge's food, which is highly recommended by Steiner, of Germany. Dr. Smith formerly used to employ Nestle's food, but has been obliged to give it up, when the bowels are affected, on account of its laxative effect. In cases of habitual constipation in young infants, which is often a very perplexing condition to the practitioner, he has found it of very great service.

Dr. A. A. Smith considered it of great importance to control the high temperature which is so frequently met with in the early stage of entero-colitis, and said that he had observed quite wonderful results from the application of cold. When the temperature rose to 103 degrees or more, he was in the habit of employing sponging or the wet-pack; but he did not approve of cold baths, because he thought they entailed too much muscular exertion on the part of the child. This application of cold, he thought, allayed nervous excitement and tended to produce sleep.

Although the disease might not be decidedly inflammatory in its early stage, yet the influences affecting children in the city during hot weather were such as to beget a high temperature. He considered external applications more beneficial than internal medication, but did not hesitate to employ both. For the last three or four years he had employed the bromides with great satisfaction, and did not know until quite recently that Dr. Salvatore Caro had read a paper, some six or eight years ago, in which he advocated their use in this affection. Later on (say after four or five weeks), when the child was suffering more from the results of the affection than the disease proper, he had found the external application of animal oils very beneficial. Of these, cod-liver oil was probably the best, and he did not employ the vegetable oils at all. Internally he had been in the habit of using salicin, which seemed to act not only as an antiseptic and tonic, but also to have a favorable effect in allaying nervous excitement. He usually gave it in simple syrup and cinnamon-water, and it always seemed to be tolerated by the stomach and well digested. The dose for a young infant was about half a grain; for a child of one year a grain and a half; and after that he increased the dose one grain for every year of the child's age.

Dr. P. Brynberg Porter spoke of the great importance of early treatment in the summer diarrhœas of children, and the great risk which mothers incurred in allowing them to run on without medical attendance. This, he thought, was well shown in the special service which had been instituted by the Board of Health in this city during the past two summers. It might possibly be only a coincidence, but it was certainly a noteworthy fact, that in both years the death-rate steadily diminished while this service was kept up. During the summer of 1877 it was especially significant that the weather was actually much warmer during this period of house-to-house inspection than it was either before or after it, and also that the death-rate immediately began to increase again about the middle of August, when the service was discontinued on account of the lack of the necessary funds for its maintenance. This happy result, he

thought, was due mainly to the fact that so many cases of entero-colitis were seen in the incipient stage and put promptly upon appropriate medicinal and dietetic treatment; and, judging from this experience, he was of the opinion that there would be a great saving of human life in this city if the service could be maintained uninterruptedly for at least the entire months of July and August.

In regard to the use of the bromides and salicin in this affection, he had employed the former, at the suggestion of Dr. Caro, some time ago, and the latter more recently, at that of Dr. A. A. Smith, but had to confess that he had been somewhat disappointed in regard to their action. It is true that in a certain proportion of cases they did seem to have a beneficial effect, but he thought that, as a rule, he could obtain the desired results more promptly and surely by other remedies. It seemed to him that no one agent fulfilled so many of the indications met with in this disease as opium, and that it could be relied upon more confidently than any other, with the exception, perhaps, of bismuth.

Dr. E. H. M. Sell said that he had treated a number of cases successfully with bromide of potassium combined with ergot, and others still with the tincture of cinchona alone. There was a certain class of cases which were due entirely to over-nursing, and these required nothing but the regulation of the time when the child should be put to the breast. Others, again, are characterized by sprue, the mucous membrane of the entire alimentary tract from the mouth to the anus being affected, and these could be set down always as due to improper food, either in addition to the mother's milk or as a substitute for it. Even when the mother said that the child always got "one cow's milk," it would usually be found that the "one cow" was stall-fed and slop-fed; and this was quite sufficient to account for the condition observed. In such cases the hyposulphite of soda acted almost as a specific for the sprue, if the diet was properly regulated.

In regard to the use of opiates, he said he never employed them under the age of one year, and very sparingly after that, for fear of the danger of narcotic poisoning, as he had twice rescued young infants from death on account of the opium which had been prescribed for them by other physicians. On the other hand, he believed that gelseminum could be employed with much greater safety, and he had found that it had the effect of lowering the temperature, diminishing the rapidity of the pulse, controlling nervous excitability, and, in fact, fulfilling every indication for which opium was employed. He was in the habit of ordering from two to eight drops of the concentrated tincture of gelseminum to be placed in a teacupful of water, and of this the child was to have a teaspoonful every half hour or every hour, according to the urgency of the symptoms.

Dr. J. H. Comfort spoke of the good results which he had obtained from pepsin. He also spoke highly of the use of bismuth, which he said he usually employed in combination with it, though he had not been in the habit of giving such large doses as Dr. Smith had recommended this evening.

Dr. J. Lewis Smith, in conclusion, said that he thought nothing could really take the place of opium. Every medicine, he said, could be given in overdoses. He considered it just as safe, if given with proper caution, under the age of one year as at any other period of life, and had never seen any bad results from its use. He had frequently given doses of half a drop of laudanum to a child of six months for a long period without observing any difficulty. In regard to the action of bismuth, it was the impression of a great many that it had merely a local effect, but he thought that it had something more than this. One medical friend told him that he had frequently noticed a peculiar odor, resembling that of garlic, in the breath of patients who were taking bismuth, but personally he had never observed it. It was well known that the stools usually became black when bismuth was being taken, and the black discoloration he had also seen in the stomach at post-mortem examinations. He believed it to be due to the action of sulphurous acid in the stomach and intestines, as the sulphide of bismuth is of this black color. In addition to its other good qualities, he considered bismuth an excellent disinfectant, and said that all observers agreed that the stools at once became much less offensive under its administration.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from May 12 to May 18, 1878.

Campbell, Jno., Lieut.-Colonel and Surgeon. Announced as Medical Director of the Department. G. O. 4, Dept. of the South, May 15, 1878.

Town, F. L., Major and Surgeon. Relieved from duty in Dept. of the Missouri, to proceed to New York City and report arrival, by letter, to Surgeon-General. S. O. 101, A. G. O., May 10, 1878.

Frantz, J. H., Major and Surgeon. Relieved from duty in Dept. of the East, and authorized to remain at his home on usual monthly certificate of disability until his health is sufficiently restored to resume duty. S. O. 101, C. S., A. G. O.

Storrow, S. A., Major and Surgeon. Assigned to duty as Chief Medical Officer of the command of Lieut.-Colonel L. P. Bradley, 9th Infy. S. O. 41, Dept. of the Platte, May 10, 1878.

Tilton, H. R., Major and Surgeon. Relieved from duty in Dept. of Dakota, to proceed to New York City, and report arrival, by letter, to Surgeon-General. S. O. 101, C. S., A. G. O.

Williams, J. W., Major and Surgeon. Relieved from temporary duty with troops at Washington Arsenal, D. C., and ordered to Dept. of the Missouri. S. O. 101, C. S., A. G. O.

Brown, H. E., Capt. and Asst. Surgeon. Relieved from duty in the Dept. of the East, and ordered to Dept. of Texas. S. O. 101, C. S., A. G. O.

Middleton, P., Capt. and Asst. Surgeon. Granted leave of absence for four months. S. O. 104, A. G. O., May 14, 1878.

O'Reilly, R. M., Capt. and Asst. Surgeon. Relieved from duty in Dept. of the East, and ordered to Dept. of the South. S. O. 101, C. S., A. G. O.

Heizmann, C. L., Capt. and Asst. Surgeon. Relieved from duty in Dept. of the East, and ordered to Dept. of the Columbia. S. O. 101, C. S., A. G. O.

Campbell, A. B., Capt. and Asst. Surgeon. Relieved from duty in Dept. of Texas, to proceed to New York City, and report arrival, by letter, to Surgeon-General. S. O. 101, C. S., A. G. O.

Corson, J. K., Capt. and Asst. Surgeon. Relieved from duty in Dept. of the East, and ordered to Dept. of Arizona. S. O. 101, C. S., A. G. O.

WILSON, W. J., Capt. and Asst. Surgeon. Relieved from duty in Dept. of the Missouri, ordered before the Army Medical Board, New York City, for examination for promotion, and after examination report by letter to the Surgeon-General. S. O. 101, C. S., A. G. O.

HALL, J. D., Capt. and Asst. Surgeon. Relieved from duty in Dept. of the East, and ordered to Dept. of Texas. S. O. 101, C. S., A. G. O.

MOSELEY, E. B., 1st Lieut. and Asst. Surgeon. To report in person to Lieut.-Col. L. P. Bradley, 9th Infy. S. O. 41, C. S., Dept. of the Platte.

SKINNER, J. O., 1st Lieut. and Asst. Surgeon. Relieved from duty in Dept. of the South, and ordered to Dept. of Arizona. S. O. 101, C. S., A. G. O.

BARNETT, R., 1st Lieut. and Asst. Surgeon. Relieved from duty in Dept. of the Gulf, and ordered to Dept. of the Platte. S. O. 101, C. S., A. G. O.

CRAMPTON, L. W., 1st Lieut. and Asst. Surgeon. Relieved from duty in Dept. of the Gulf, and ordered to Dept. of Dakota. S. O. 101, C. S., A. G. O.

TAYLOR, M. E., 1st Lieut. and Asst. Surgeon. Relieved from duty in Dept. of the Gulf, and ordered to Dept. of the Missouri. S. O. 101, C. S., A. G. O.

SHUFELDT, R. W., 1st Lieut. and Asst. Surgeon. To accompany Co. D, 4th Infy., from Omaha Barracks to Ft. Laramie, Wyo., and on arrival report to the com'd'g officer for duty at that post. S. O. 41, C. S., Dept. of the Platte.

WRIGHT, J. J. B., Colonel (retired). Died at Carlisle, Pa, on May 14, 1878.

Medical Items and News.

CONTAGIOUS DISEASES — WEEKLY STATEMENT.—Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending May 18, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.
May 11, 1878....	0	5	70	0	58	45	1
May 18, 1878....	1	7	62	8	68	37	1

ON OXALATE OF CERIUM IN CHRONIC COUGH.—"I have for some time used the oxalate of cerium in cases of chronic cough with shortness of breathing, with very marked success. One case under observation is a proof of its good effects as a sedative. A lady has suffered for some years with cough and difficulty of breathing, on the least exertion 'the outcome of an acute attack of pneumonia,' the cough being most troublesome in the morning on getting up—so bad as to cause sickness. I prescribed 5 gr. half an hour before rising. The physical signs observed in her case have been loud bronchial breathing, with great abdominal action, impaired resonance over lungs, with a slight dulness at the apex of left lung. The most marked physical changes since taking the ox. cerium are less noise in breathing, less abdominal action, no cough in the morning, and increased strength. I could relate other cases, but will only mention one other, it being under my care in our village hospital: a case of consolidation of the right lung. The rest given to the lung by the ox. cerium in gr. 5 doses is observable in the comfort in breathing, and the cessation of cough for twenty-four hours after each dose. The medicinal properties of ox. cerium I believe to be purely sedative, a great desideratum in the treatment of lung diseases, the difficulty being to find a drug that will not upset the digestive organs. In all cases wherein I have used the ox. cerium the only symptom observable from its use is a slight dryness of mouth."—*By Thomas Clark, L.R.C.P. and S.E., in Practitioner.*

METRIC SYSTEM IN THE MARINE HOSPITAL SERVICE.—The metric system has been adopted by the Marine Hospital Service. The *Louisville Medical News* alludes thus pleasantly to the fact: "Since the publication in the *News* of the article upon the metric system the Government has ordered its adoption by the Marine Hospital Service." We congratulate our friend Cowling on his success, which is probably due to the fact that his journal is regularly read in Cabinet meetings.

THE EASIEST WAY TO DROWN.—For those who may desire to test it we quote the following from Dr. Tracy (*Pop. Sci. Monthly*): "If death by drowning be inevitable, as in a shipwreck, the easiest way to die would be to suck water into the lungs by a powerful inspiration, as soon as one went beneath the surface. A person who had the courage to do this would probably become almost immediately unconscious, and never rise to the surface. As soon as the fluid fills his lungs, all feelings of chilliness and pain would cease, the indescribable semi-delirium that accompanies anæsthesia would come on, with ringing in the ears and delightful visions of color and light, while he would seem to himself to be gently sinking to rest on the softest of beds, and with the most delightful of dreams."

TREATMENT OF BOILS.—As the result of physiological experiments, Dr. Planat (*Lyon Médical*) has been led to the use of arnica in all cases of superficial acute inflammation, as furuncles, anginas, erysipelas, etc. He states that arnica aborts all furuncular eruptions, except those accompanied by diabetes, with remarkable promptness. For external use he employs: *Recipe.*—Extract of fresh arnica flowers, 10 parts; honey, 20 parts. If this is too liquid, he adds lycopodium. The mixture is applied to the inflamed part, and covered with oil-silk. Equally good results will be obtained in the same way by the internal administration of tincture of arnica in doses of twenty-five to thirty drops every two hours. M. Planat adds that the extinction of the furuncular eruption is so rapid that it seems impossible to deny a specific elective action.—*Med. Press and Circular.*

THE MEDICAL SOCIETY OF VICTORIA (Australia) have by a committee made a report on the prevalence of phthisis in Victoria. A comparison is made between the rate of mortality from this disease in England and Victoria. In England the rate for 10,000 persons was 25.66 in five years (from 1860 to 1864), and 22.83 in five years (1870 to 1874); while in Victoria it was only 13.08 and 12.60 for the same periods. It recognizes the fact that most cases of phthisis represent really the final stage of some acute inflammatory affection, generally pneumonia. It admits that climate has much to do with the origin of the complaint, as dampness of the air and soil contributes to all inflammatory affections of the lungs; but it alleges too much stress is usually laid on the density of population as determining the amount of phthisis in any district, which is shown very clearly by statistics.

It is claimed that the general death-rate over the

whole colony (Melbourne excepted) has been reduced about one-third in the ten years between 1861 and 1871, the exception being due to insanitary conditions operating against that city.

A Model Boarding-school Principal.—The Baroness Marie S——, a young lady of sixteen, was until recently a pupil at the female seminary of Mme. Durivage, a fashionable establishment in Berlin. Strange as it may seem, beautiful young baronesses are, apparently, no more proof against the evil designs of unprincipled individuals of the opposite sex, than some of their sisters of less distinguished rank, and, notwithstanding the extreme seclusion in which the inmates of such an institution are supposed to be kept, this wayward miss managed in some way or other to get the opportunity of forming a *liaison* with a certain gay Lothario about town by the name of Von Derffling. As a result of this keeping company with a young man, the unfortunate girl found to her consternation that she was likely to become a mother; and when the fact of her *grossesse* could no longer be concealed from those about her, what should the high-principled matron of this select institute dedicated to the cultivation of the arts of the chaste Pallas Athene do but herself take her to an establishment known as "The American Lying-in Asylum," in order to have an abortion produced on her, at the expense of her gallant admirer.

This last-named institution, it would seem from the account given of it by the prosecuting attorney, on the occasion of the trial last month of the originators and proprietors of it, was a most extraordinary and infamous place. It appears that in April, 1875, four Americans, under assumed and high-sounding names, rented a small house on Louise Street in Berlin, and applied to the medical authorities for permission to open what they called an "American lying-in asylum." All of them professed to be experienced obstetricians, and they exhibited diplomas from various American medical colleges, apparently made out in proper form. These diplomas the superintendent of the city medical department examined with gross carelessness, and he did not hesitate to grant the application of the so-called physicians.

At first they did but a very small business, but in the course of a few months, by a system of extensive advertising, and by employing the most crafty agents, and by resorting to the most disreputable contrivances, they succeeded in acquiring quite a large clientelle. When a patient applied for admission at the "asylum," in order that she might await her natural confinement, she was told that the house was full just then, and a box of pills was furnished her, which, if she should commence taking at once, would render parturition perfectly painless. These pills contained noxious substances, compounded for the express purpose of producing pain and nausea, and when the unfortunate woman had been made ill by them, she would naturally return to the institution to find out what was the matter with her. She would then be coolly informed that on the payment of a fee of twenty-five dollars an examination of her case would be made. In her anxiety about her condition the patient generally consented to this, and then, after a mock-explanation the "physician," to her astonishment and consternation, announced that she was afflicted with an ovarian tumor. For the removal of this the sum of one hundred dollars was demanded, and the poor creature was so terrified by this information that it was usually forthcoming. When the money had been paid, a most revolting scene was enacted. While two of the four worthies held the miserable victim upon the table, a third would perform an abortion in the most brutal and bungling manner. No anæsthetic was employed, it would seem, and, in order to drown the poor creature's shrieks of agony, the fourth "learned professor" evoked the shrillest strains from a bugle kept on hand for the purpose. Such a thing would seem incredible had it not been solemnly sworn to in a court of justice.

Most of the women who came to the institute, however, did so for the express purpose of having abortion produced, and up to the time that the "asylum" was closed by the interference of the law, more than three hundred such operations were performed. It is said to be a fact that the patients were almost invariably ladies belonging to the higher classes of society, and that among them were many school-girls, like the Baroness Marie S——, whom their confiding parents had sent to aristocratic seminaries in Berlin.

The manner in which the doings of this vile establishment were at last exposed was as follows: It seems that a young gentleman of the same proclivities as Herr Von Derffling, and also an intimate friend of that elegant captivator of the fair sex, had sent two girls whom he had seduced to the "asylum" to be operated upon, and that the father of one of them, a nobleman of quite high rank, accidentally discovered what his daughter had done. He then disowned her, and at once gave information against the "American doctors" to the police. One of them was absent from the city, but the other three, together with a number of accomplices, the three young ladies, Von Derffling and his friend, and Mme. Durivage, the high-toned principal of the aristocratic seminary, were all arrested. When the premises were searched a large number of papers and the instruments used by the quacks in the perpetration of their crimes were found. In the garden back of the house there was a sort of furnace, which, according to the confession of one of their assistants, was used for the burning of the fœtuses, and hidden under a large dunghill were the charred remains of quite a number of them.

It is gratifying to know that these infamous miscreants, with the exception of the one who was absent from the city at the time of the arrest, and has not yet been captured, received the punishment which they so richly deserved. One of the "professors" was sentenced to death, and the other two to penal servitude for life; the agents and midwives in their employ to terms of solitary confinement varying from ten to fifteen years, and Von Derffling and his friend each to five years' solitary confinement; while Mme. Durivage was condemned to the same punishment for a term of eight years. It is stated that when the madame received her sentence she gave a loud shriek, foamed at the mouth, tore her hair, and acted like a lunatic generally. It is to be hoped that her eight years of incarceration will have a salutary effect, and teach her a lesson which she will not be likely to forget in case she ever resumes her former calling, and also that if there are any other principals of female seminaries in Berlin or elsewhere of the same exalted morality, they will not neglect to take warning by the melancholy example thus afforded them.

Treatment of Chronic Ulcers of the Vulva and Cervix Uteri.—Dr. Guillaumet, of Paris, recommends very highly the employment of sulphuret of carbon in the treatment of these and other chronic ulcers. The disagreeable smell of the liquid can be overcome to a great extent by the addition of the essence of bitter almonds, or of mint, in the proportion

of ten or fifteen drops to ten grammes (ʒ ijss.) of the sulphuret of carbon. Iodine, which is very soluble in the sulphuret, diminishes its odor considerably, and at the same time increases its reparative and stimulating properties. Dr. Guillaumet employs the following combinations: Sulphuret of carbon, 12 grammes (ʒ iij.), and iodine 1 gramme (gr. 15); or sulphuret of carbon 16 grammes (ʒ iv.), tincture of iodine 1 gramme (m. 15), and essence of mint four drops. The bottle containing the fluid should be held close to the sore to be dressed, and far from the light. A wick of charpie should be dipped lightly into the liquid, and the surface of the sore lightly brushed with it. The sore should then be covered with a powder of subnitrate of bismuth and a layer of dry charpie. Care must be taken not to apply too much of the liquid. In treating ulcers of the neck and womb the *modus faciendi* is the same, except that more powder should be used, which should be kept in place by a tampon of cotton-wool. The tampon should be left *in situ* for about twelve hours.

Scrofulous ulcerations of the vulva, chancres, syphilitic erosions about the anus and genitals, and mucous patches have been cured in a few days by this treatment. The sulphuret of carbon acts as an irritant, a refrigerant, and an anæsthetic. Its action is entirely local, and limited to the diseased tissues. In spite of the irritation it causes, the granulations rarely become so exuberant as to require repression. The frequency of the dressings should depend on the age and the condition of the sore, but they should never be repeated oftener than once a day.

Congrès International d'Hygiène.—An International Congress of Hygiene, to which all medical men are invited, will meet in Paris during the first fortnight of the month of August.

Treatment of Puerperal Metrorrhagia. In cases of post-partum hemorrhage, Dr. Donovan has employed successfully the tincture of cannabis indica in doses of 18 minims. The action of the drug is rapid and certain, even when ergot has failed. The tincture of cannabis indica is also efficacious against the other forms of metrorrhagia, and especially against a too abundant menstrual flux.

Treatment of Atony of the Bladder.—Prof. Langenbeck has recently employed hypodermic injections of ergotine with remarkable results, in three cases of atony of the bladder due to enlarged prostate. The treatment was followed by a rapid increase in the contractility of the bladder, which enabled the patient to evacuate larger quantities of water at a time. One of the cases was that of a man sixty-two years of age, who urinated three or four times a day, but only passed about 7½ ounces of urine at each micturition, while over a pint could be evacuated by the catheter. On the first day of the treatment, a solution containing 12 cgr. (gr. ij.) of the ergotine of Bonjean was injected under the skin. On the same day the patient could pass his water more freely, and a few days later it was found that the hypertrophy of the prostate had greatly diminished. After four injections the atony of the bladder was completely overcome. An ointment of the iodide of potassium was used in the rectum at the same time, and Vichy water was taken internally, but Prof. Langenbeck thinks that he is justified in ascribing the cure mainly, if not solely, to the injections of ergotine.

Pills for Amenorrhœa.—In cases of idiopathic amenorrhœa without much reaction in the economy, when there is reason to believe that the suppression of the menses is due, either to an insufficient fluxion to the genital organs, or to a failure of evacuation in consequence of inertia of the uterus, M. Courty recommends the following:

℞. Pulv. rutæ,
Pulv. sabinæ,
Pulv. ergotæ..... ää gr. i.
Pulv. aloes..... gr. ½.
M.

Three of these pills are administered on the first day, six on the second, and nine on the third.

Large Against Small Doses.—The Dublin *Medical Press*, in an elaborate leader upon the "Fiction of Small Doses," says: "In all those cases in which the therapeutic efficacy of certain drugs cannot be questioned by any one, however sceptical he may be, or to whatever medical persuasion he may belong, the largeness of the dose seems to be an important factor in its therapeutic action on the system, and the influence it has upon the disease for which it is prescribed. Hence the unquestionable efficacy of large doses of iodide of potassium in secondary syphilis; of large doses of quinine in arresting the progress of intermittent fever; of comparatively large doses of mercury, in some form or other, in the treatment of syphilitic iritis, and certain syphilitic affections of the skin; of large doses of bromide of potassium in some cases of epilepsy; of comparatively large and long-continued doses of arsenic in certain skin diseases; and of large doses of the hydrated peroxide of iron in the treatment of certain neuralgias. It is the same with other and less potent remedies. Large and frequently repeated doses of the liquor ammoniæ acetatis, or a full dose of Dover's powder, will act upon the skin and excite diaphoresis, when a grain or two of the one, or a few drops of the other, would have no effect whatever. Give a small dose of morphia to a patient in the agonies of a severe attack of colic, or in a paroxysm of mania, and you might as well try to soothe him with the mesmeric pass. Administer a mild aperient to a man suffering from constipation and biliary obstruction, and ten to one you will rather aggravate than remove his complaint."

Measles has been very prevalent in some parts of Ireland.

Wooden Street Pavement for Hospitals.—An effort is being made in Dublin to obtain wooden instead of stone pavement in streets upon which hospitals are situated.

Hydrophobia from a Cat.—A case of death from hydrophobia, the result of bite of a cat, is reported as having occurred in Manchester, Eng.

Medical Night-Service.—A system of medical night-service has been established in Algiers, on the same basis as the one which was already in operation in Paris. An additional feature, however, is that the physician, who is called during the night, is obliged to fill out a blank, stating the age, sex, and profession of the patient, and the affection from which he or she appeared to be suffering. These bulletins will be collected every three months, and they will furnish a means of determining the utility of the night-service system.

Wood-Oil.—A wood-oil obtained from the roots of trees, and especially resinous trees, such as the pine and the fir, is used in Sweden for illuminating purposes. The roots left in the ground after the levelling of forests are utilized in the production of this oil. These roots are distilled dry, that is to say, they are

superheated in large, hermetically-sealed retorts, when they give off a certain quantity of oil, turpentine, creosote, tar, acetic acid, vegetable charcoal, resinous oils, etc. On account of the large quantity of carbon which it contains, the oil burns with a great deal of smoke, and hence specially constructed lamps are required for its consumption. In its natural state, without admixture, the wood-oil is the cheapest illuminating substance known; it costs about two rs. (ten cents) a quart. It cannot explode, and it burns longer (about thirty-five per cent.) than photogene.

Death of a Medical Student from Small-Pox.—Mr. Arthur Ogier, a medical student in Marseilles, France, died recently of small-pox, which he contracted during his attendance at the hospital. Several of the French journals take advantage of the stir caused by the death of this young man, to urge the compulsory re-vaccination of all medical students as soon as they begin to attend the hospitals. A similar rule would, perhaps, not be amiss in this country, although, in this city at least, in consequence of the isolation of variola patients, the students are but little exposed to danger.

The Mutual Autopsy Society.—Louis Asseline, one of the members of this society, died recently, and the autopsy was performed by Prof. Broca. It was found that death, which had been sudden, had resulted from rupture of the left auricle of the heart. The rupture was due to fatty degeneration of the organ; the muscular fibres had almost disappeared, and it was a matter of surprise that life had been prolonged so long under such conditions. The brain weighed 1,460 grammes. It was noticed that the fronto-parietal sutures were not ossified, although M. Asseline was forty-nine years of age, and the theory was mooted that this delay in the closure of the anterior sutures might have been due to the cerebral activity.

Chloroform Narcosis Cured by Nitrite of Amyl.—An English journal reports a case of threatened death from chloroform, in which the patient was resuscitated by the inhalation of a few drops of nitrite of amyl. The indication for the use of amyl is furnished by the sudden failure of the pulse.

Another means of treating a threatening narcosis caused by chloroform is recommended by M. Baillée, of Belgium. It consists in the introduction of a small piece of ice into the rectum. A moderate degree of pressure suffices to overcome the resistance of the sphincter. The ice melts in the intestine, and immediately excites a deep inspiration, which is followed by the re-establishment of natural respiration and of the cardiac functions.

This treatment might also prove serviceable to excite respiration in the new-born child.

Rapid Expulsion of Tapeworms.—The following case, which is reported by Dr. Paulini, presents some points of interest: A female prisoner, who was under treatment for an ulcer in the prison hospital, passed a long piece of tapeworm on the 24th of February. At eight o'clock on the succeeding morning the half of the following powder was administered in water: ℞. Flor. kousso, 3 vj., kamela 3 jv. M. At nine o'clock the patient was given a dose of Carlsbad salts, and an hour later the other half of the powder was administered. There was no vomiting. About half-past twelve the patient went to stool, and a coil of tapeworms was found in the passage. On examining this coil, Dr. Paulini found four heads of the tænia solium attached to pieces of the worms, from half a yard to a yard in length, and two pieces without heads. The combined length of the pieces passed was forty-one yards.

Case of Hydrophobia Cured by Oxygen.—This case is reported by Drs. Schmidt and Zebeden, from Russia. The first symptoms of rabies appeared seventeen days after the injury. The patient was made to inhale three cubic feet of oxygen, and two hours afterwards he was in a state of perfect calm. Two days afterwards the symptoms of rabies reappeared, and another inhalation of oxygen was administered with the same success. This time the inhalation was continued for forty-five minutes. A slight dyspnœa which persisted after the disappearance of the graver symptoms, was treated for three weeks by the monobromide of camphor.—*Lyon Médical*, April 28th.

Means of Preventing Pitting in Variola.—This consists simply in puncturing the vesicles with a needle as soon as they have attained a moderate development, and in frequent washing with lukewarm water. The punctures must be repeated often enough to keep the little wounds open, or as often as the vesicles show signs of refilling. The work is one which requires time and patience, but this is of small moment, as the task can be entrusted safely to a mother or nurse. A Dr. Bernard states that he has employed this method with gratifying success in a severe epidemic of variola.

The Telegraphic Disease.—Onimus (*Courrier Médical*) calls attention to this disease, somewhat analogous to, but much more severe than, writers' cramp. Morse's instrument is blamed for causing the greatest number of cases, probably because of the extremely close attention required in using it to avoid errors. The symptoms are chiefly palpitation, over-excitement, vertigo, insomnia, sometimes weakening of the sight, and a sensation of constriction at the nape of the neck. The over-excitement is succeeded by depression, sadness, and entire loss of tone. The patient loses memory, and insanity even may follow. The symptoms are more readily produced in women than in men.

Rhode Island has organized a State Board of Health. Strange to say, Dr. Snow is not a member. This is certainly not a very strong argument in favor of the good intentions of the framers of the law.

Conduct of the Surgeon in Cases of Mutilation of the Hand.—Prof. Verneuil (*Courrier Médical*) says, when you have to treat a patient suffering from a hand crushed in any way whatever, take as an absolute rule to cut away nothing, to regulate nothing with the bistoury. He gives the reasons for this, first, that parts which it would appear necessary to cut away at first regain their shape and usefulness; and secondly, that operations performed two or three months after, when the parts are in a state of absolute calm, give much better results.

Chlorate of Potash in Catarrh of the Bladder.—Prof. G. Edlefsen, of Kiel, publishes in the *Deutsch. Archiv klin. Med.*, xix., 1, 1877, an essay on the treatment of catarrh of the bladder by chlorate of potash. The view lately advanced that the best method of treating cystitis, even acute cases of it, consists in the introduction into the bladder, through the urethra, of water or medicated fluids, is not in accordance with his observation. The remedy he recommends is chlorate of potash internally, which never damages the stomach or any other organ, and substitutes turpentine perfectly in cases where turpentine cannot be given.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEHN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

7.—PIL. PHOSPHORI CUM FERRO ET QUINIA ET NUC. VOM.	Phosphori 1-100 grain. Ferri Carb. 1 grain. Quiniæ Sul. 1 grain. Ext. Nuc. Vom. ¼ grain.	2 75
8.—PIL. PHOSPHORI CUM QUINIA	Phosphori 1-50 grain. Quiniæ Sul. 1 grain.	2 75
9.—PIL. PHOSPHORI CUM QUINIA CO	Phosphori 1-50 grain. Ferri Red. 1 grain. Quiniæ Sul. ¼ grain. Strychniæ 1-60 grain.	2 00
10.—PIL. PHOSPHORI CUM QUINIA ET NUC. VOM	Phosphori 1-50 grain. Quiniæ Sul. 1 grain. Ext. Nuc. Vom. ¼ grain.	2 75
11.—PIL. PHOSPHORI CUM QUINIA ET DIGITALE CO	Phosphori 1-50 grain. Quiniæ Sul. ¼ grain. Pv. Digitalis ½ grain. Pv. Opii ¼ grain. Pv. Ipecac. ¼ grain.	2 00
12.—PIL. PHOSPHORI CUM DIGITALE CO	Phosphori 1-50 grain. Pv. Digitalis 1 grain. Ext. Hyoscy. 1 grain.	1 50
13.—PIL. PHOSPHORI CUM DIGITALE ET FERRO	Phosphori 1-50 grain. Pv. Digitalis 1 grain. Ferri Red. 1 grain.	1 50
14.—PIL. PHOSPHORI CUM CANNABE INDICA	Phosphori 1-50 grain. Ext. Cannab. Ind. ¼ grain.	1 75
15.—PIL. PHOSPHORI CUM MORPHIA ET ZINCO VALER	Phosphori 1-50 grain. Morphiæ Sul. 1-12 grain. Zinci Valer. 1 grain.	2 00
16.—PIL. PHOSPHORI CUM ALOE ET NUCE VOMICA	Phosphori 1-50 grain. Ext. Aloes Aq. ½ grain. Ext. Nuc. Vom. ¼ grain.	1 50
17.—PIL. PHOSPHORI CUM ZINCO CO	Phosphori 1-50 grain. Zinci Sul. 1 grain. Lupulinæ 1 grain.	1 50
18.—PIL. PHOSPHORI CUM OPIO ET DIGITALE	Phosphori 1-50 grain. Pv. Digitalis ½ grain. Pv. Ipecac ¼ grain. Pv. Opii ¼ grain.	1 50
19.—PIL. PHOSPHORI CUM STRYCHNIA	Phosphori 1-50 grain. Strychniæ 1 60 grain.	1 50
20.—PIL. PHOSPHORI CUM CANTHARIDE	Phosphori 1-50 grain. Pv. Nuc. Vom. 1 grain. Sol. Cantharidis Con. 1 ♏.	1 50
21.—PIL. PHOSPHORI CUM BELLADONNA	Phosphori 1-100 grain. Ext. Belladonnæ ½ grain.	1 50
22.—PIL. PHOSPHORI CUM FERRO ET STRYCHNIA	Phosphori 1-100 grain. Ferri Carb. 1 grain. Strychniæ 1-60 grain.	1 50
23.—PIL. PHOSPHORI CUM QUINIA ET FERRO ET STRYCHNIA	Phosphori 1-100 grain. Quiniæ Sul. 1 grain Ferri Redacti 1 grain. Strychniæ 1-60 grain.	2 75
24.—PIL. PHOSPHORI CUM EXT: ACONITI	Phosphori 1-50 grain. Ext. Aconiti 1-16 grain.	1 50

For **Efficacy, Perfection,** and **Freedom from harm,** Warner & Co.'s Pills of Phosphorus are unrivalled. The process **originated** and **perfected** by W. R. WARNER & Co., for the administration of Phosphorus in pill form, diffuses the Phosphorus, in its elementary state, thoroughly through the soft and non-resinous mass in a **state of solution,** a result by **no other process** attainable. The value of Phosphorus as a remedial agent is impaired if the element is not exhibited in **its free state,** and protected from oxidation by a perfect **and impervious coating of pure white sugar. You are cautioned to avoid cheaper and inferior brands.**

Messrs. WM. R. WARNER & Co., *Manufacturing Chemists, etc.*

GENTLEMEN:—The Phosphorus Pills submitted to me for Chemical Analysis and Microscopic examination afford only traces of Phosphoric Acid, and contain the one twenty-fifth of a grain (gr. 1-25) of the element in each Pill, as expressed upon the label; they do **not exhibit particles** of undivided Phosphorus, the mass being **perfectly homogeneous** in composition, soft in consistence, and thoroughly protected by the **non-porous coating** of sugar from the oxidizing influence of the air. Each Pill is an example of what skill, care, and elegant Pharmacy can do. **I regard them as a marvel of perfection.** Very respectfully,

A. E. MCLEAN, *Analytical Chemist and Microscopist,* Late of Gardner & Ainslie's Laboratory, Edinburgh, Scotland.

FOUGERA'S COMPOUND IODINIZED
COD LIVER OIL

Since the introduction of this oil in 1856 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

QUINETUM PILLS

(Sugar-Coated.)

The name **Quinetum** was given by Dr. De Vry to the collective alkaloids obtained from Peruvian bark; it has been extensively used by physicians throughout Holland in cases where the salts of quinine had been habitually employed. Dr. H. J. Vinkhuysen, Physician to the Household of the King of the Netherlands, has closely observed its effects, and arrived at the following conclusions:

1. The action of Quinetum in cases of marked or larval malaria, and especially in rheumatic affections due to malarious influences, is incomparably greater than that of quinine.

2. The tonic action of Quinetum is similar to, and even greater than that of quinine.

3. The influence of Quinetum in chronic cases is greater than that of quinine.

4. Persons who are liable to suffer from the toxic effects of quinine, and who therefore cannot take it without the greatest discomfort, can take Quinetum without this unpleasant effect, and yet obtain a similar therapeutical result.

5. Quinetum never causes noises in the ears.

6. Quinetum does not produce the unpleasant and even dangerous symptoms of quinine when given during the fit, and may be taken during the fit without causing any unpleasant feeling

7. In all forms of pure malarial intermittent fever, Quinetum has the same apyretic effect as quinine, but is less powerful and acts more slowly. It must therefore be given in large doses, and at longer intervals before the ague fit, than quinine.

8. The only malarious disease in which Quinetum cannot be employed in place of quinine, is in pernicious fever. Quinetum requires more time to act than quinine, and as rapidity of action is absolutely necessary in this disease, Quinetum cannot be used in it as a substitute for quinine.

These Pills may be obtained of Druggists, or will be sent by mail, post-paid on receipt of price.

LONDON M'F'G CO.'S
ESSENCES OF MEATS.

For Invalids, Travelers, and Persons of Delicate Health.

ESSENCE OF BEEF,
ESSENCE OF MUTTON,
ESSENCE OF CHICKEN.

These Essences consist solely of the juices of the Finest Meats, extracted by a gentle heat, without the addition of water or any substance whatever. They contain, therefore, the most stimulating and exhilarating portions of Meats, calculated to invigorate the heart and brain **immediately;** being without any gelatinous injurious elements, which require solution.

They are very effective in cases of **Sea Sickness.** Persons contemplating a sea voyage, or water travel of any kind, will find the Essences invaluable as a nourishing and stimulating preparation. They will be retained by the stomach in very critical cases of illness, when the most carefully prepared soup is rejected. They are also used with very satisfactory results in **Children's** complaints. Our Essences are heavy liquids, and, when placed upon ice, take a jellified form, retaining the fine flavors of the meats, thus making them very refreshing and pleasant to the taste.

Taken Direct from the Can without any Preparation whatever.

USE A DRY SPOON AND LEAVE THE CAN PARTLY OPEN. WILL KEEP IN ANY CLIMATE.

FOR SALE BY ALL DRUGGISTS.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for **Animal Virus**, we have established stables for its propagation upon carefully-selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly **reliable** and **pure** article, which we are prepared to furnish **fresh, daily.**

We can also furnish, to those who prefer it, **Humanized Virus**, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (postpaid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides			$1.50
5 large Ivory Points,	"	"	.80
Large Ivory Points, less than 5,	"	" each	.25
1 Crust, new method, in air-tight Glass Capsule			2.00
From Healthy Infants, 10 small Ivory Points			1.50
1 Crust from Unruptured Vesicles			2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus, if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results obtained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish **Uncharged Ivory Points**, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1,000, $2.00
Large	per 100, 50 cents; per 1,000, 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.

Scarifying Vaccinator, Steel Nickel-Plated. See Cut. Each 25 Cents.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE,*** containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: Gluten is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE,*** *and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

MALTINE WITH HOPS.

MALTINE, FERRATED:
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

MALTINE WITH PHOS. IRON AND QUINIA:
A powerful general and nutritive tonic.

MALTINE WITH PHOS. IRON, QUINIA AND STRYCH.:
A powerful nutritive, general and nervous tonic.

MALTINE WITH HYPOPHOSPHITES:
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

MALTINE WITH PEPSIN AND PANCREATINE:
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE.*** We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

MALTINE WITH BEEF AND IRON:
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

MALTINE WITH COD LIVER OIL:
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

MALTINE WITH COD LIVER OIL AND PHOSPHORUS:
In this combination the Phosphorus has no irritant effect upon the stomach.

MALTINE WITH COD LIVER OIL AND IODIDE OF IRON:
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

MALTINE WITH ALTERATIVES:
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ¼ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

WYETH'S DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of Iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the Iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering **IRON** in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French, and American Liquor Ferri Oxidi Dialys., which we have examined, give acid reaction to test paper If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our Dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto the best remedy known in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store to supply such an emergency.

FULL DIRECTIONS ACCOMPANY EACH BOTTLE.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for ONE DOLLAR, containing sufficient for four months' treatment. Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., etc., sent on application.

JOHN WYETH & BRO.

WYETH'S COMPRESSED TABLETS OF CHLORATE OF POTASH.

For Hoarseness, Bronchial Irritation, Sore Throat, Diphtheria, Croup, etc., etc.

Chlorate of Potash is a remedy of acknowledged value in cases of Diphtheritic Sore Throat, and in Inflammation of the Mouth and Throat, induced by a depressed state of the system. In these instances, as in the milder forms of Croup, it has, besides its depurative and detergent effects, a solvent action on the deposits characteristic of those troublesome and dangerous affections. It relieves Hoarseness; and in many cases of Fetid Breath from disordered secretions, it proves an efficient corrective. Its virtues in simple Angina, or ordinary Sore Throat, are recognized by many of the most eminent physicians.

As the taste of this article is not disagreeable, we have prepared it in the form of Compressed Tablets, thus giving the patient the full benefit of its action, undiluted with Sugar, Gum, or other vehicles, which would not only prevent its effects, but which sometimes themselves offend the stomach.

The Lozenges usually contain about twenty-five (25) grains of gum and sugar, with two grains of the Chlorate of Potash, while each of these Pills contains simply five grains of the Chlorate, all of which, dissolved in the saliva, acts on the effected mucous membranes.

If allowed to dissolve in the mouth, the topical effect is much more efficient than a saturated solution, as while the solution is but temporary, the tablet really acts as a continuous gargle.

FOR SORE THROAT, HOARSENESS.

DIRECTIONS.—Adults should take one every hour or two until relieved, allowing it to dissolve slowly in the mouth. Children, half of one as often.

For Offensive Breath, no remedy will give more certain relief; use one, two, or three times a day.

For Diphtheria, Croup, and the more serious ailments, the physician should direct.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatin compounds—in this form the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so abundantly satisfactory, that we are confident that further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PEPSIN, and one of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration. The increased benefit to the dyspeptic being due to a full and effective dose of each, freed from the unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS.—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give a fourth or half, according to age,

JOHN WYETH & BRO., Chemists, Philadelphia.

JOHNSTON'S FLUID BEEF.

The subscribers solicit the special attention of Physicians to the exceptional merits of the above reparation as a resuscitating stimulant, in a form capable of digestion and assimilation by the feeblest invalid or infant.

It is well known in the profession that Meat Extracts are simply "the soluble salts of flesh," and, as such, have desirable stimulative qualities, but that *the elements of nutrition are wanting.*

Baron Liebig, in the *Lancet* of November 11, 1865, says:—

"Were it possible to furnish the market at a reasonable price with a preparation of Meat combining in itself the albuminous together with the extractive principles, such a preparation would have to be preferred to the "Extractum Carnis," for it would contain ALL the nutritive constituents of Meat." Again: "I have before stated that in preparing the Extracts of Meat the Albuminous principles remain in the residue; they are lost to nutrition; and this is certainly a great disadvantage."

JOHNSTON'S FLUID BEEF is a combination of the extractive and proteine principles which will at once recommend itself to all capable of judging. In its manufacture, the Beef is first treated so as to obtain the Albumen and Fibrine in a separate and highly concentrated form: then, with the view of securing easy digestion by presenting a greatly increased surface to the action of the gastric juice, these nitrogenous compounds are reduced to a powder capable of suspension in water, which, added to Extract of Meat, procured upon the most approved principles, furnishes the entire constituents of Beef in a condition which the most feeble stomach can readily digest and assimilate, thus, with the least possible expenditure of vital force, *supplying to the blood all that is necessary to impart tone to the nerves and substantial food for brain, bone and muscle.*

From the "modus operandi" it will be seen that the preparation is no untried chemical compound, but simply animal food so treated as to secure a facility of digestion and assimilation hitherto unattainable, and this in combination with all the stimulating properties of the most approved extracts and a more acceptable flavor, The preparation is in use in the leading hospitals (being generally prescribed by the British Medical Faculty), and has been popularly accepted wherever it has been introduced.

EXTRACTS FROM REPORTS BY LEADING AUTHORITIES.

It is one of the most perfect foods I have ever examined.—W. HARKNESS, F.C.S.L., *Analyst to the British Government.*

This is a highly nutritious article of diet, contains all the elements of Flesh Food in a concentrated form, is very palatable and easily digested, and is eminently suited for dietetic purposes, especially for invalids.—STEVENSON MACADAM, Ph.D., F.R.C.S., F.C.S., Edinburgh.

It is a great boon both to the invalid and to the public.—Professor MILLAR, Edinburgh.

I can very strongly recommend Johnston's Fluid Beef.—Professor CHARLES CAMERON, Dublin.

I fully expect that it will ere long take precedence both in professional and public favor of all articles of a like kind, as it possesses qualities superior to all of them.—Dr. SMART, Edinburgh.

It is the most perfect food I know of for invalids, and is especially useful in the diarrhœa of children.—ED. WORTHINGTON, F.R.C.S., Edinburgh.

As a stimulative and recuperative agent "Johnston's Fluid Beef" has a very general adaptation, and there are few bodily ailments where it could not be prescribed with advantage. We may, however, specialize all affections of the Alimentary Canal, notably "Cholera Infantum," and general lack of vitality. It is also invaluable in convalescence, lactation, and as a substitute for alcohol.

Physicians will be furnished with samples, gratis, on application to

THE BEST IS THE CHEAPEST.

"IN Burr's Improved Nursing Bottle all objections have been successfully overcome."

BURR'S Nursing Bottles

have been recommended and indorsed by all the leading Physicians and Druggists for the past ten years.

They are made of the very best and purest material, and by the most skilful workmen.

Nursing bottles and tubes should be thoroughly cleaned immediately after using. This is of the greatest importance, as the life of the infant depends on it.

It is almost impossible to get at the tube of the imitation Nursing Bottles in order to clean them. Carelessness in this respect is to be carefully guarded against, and the mother should look to it that this advice is followed. Restlessness, gastric irritation, griping pains and fits of screaming are the consequences of neglecting this matter, and ignorant people blame the bottle, when these results should be attributed to the carelessness of the nurse and want of cleanliness of the bottle and tubes.

In the genuine BURR'S IMPROVED NURSING BOTTLE, the nipple-holder tube-connector and mouth-guard are all ingeniously combined in one piece of hard, polished wood. It is so constructed that the nipples are very firmly held, yet they can be easily taken off for cleaning the tube and replaced in an instant.

AVOID DANGER

And all nursing bottles where the nipple-holder, mouth-guard and tube-connector are of metal, or in more than one piece.

The genuine Burr's Improved Nursing Bottles are made in eight different styles, and retail at from twenty-five to seventy-five cents.

See that the patent stamps are on the mouth-guard and stopper, and that the words "Burr's Patent Nursing Bottle" are blown in each bottle.

M. S. BURR & CO., Manufacturers, 485 Tremont St., Boston, Mass.

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,
GALVANIC BATTERIES,
BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8¼ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**

COSMOLINE

[Unguentum Petrolei]

Sample Furnished on application.

The Post-Office Laws forbid anything of an oleagenous nature being sent through the mails.

THEOPILUS REDWOOD, Ph.D., F.C.S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these, the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color and a smooth, jelly-like appearance, and is almost wholly free from odour or taste. It is free from, and insoluble in water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our *Materia Medica*."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

THE LANCET ANALYTICAL REPORT ON UNGUENTUM PETROLEI.

From the LANCET, London. October 20th, 1877.—UNGUENTUM PETROLEI.—Simi-transparent, pale yellow in colour, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From the MEDICAL TIMES AND GAZETTE, London, October 20th. 1877.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently, without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also as a vehicle for making ointments, as a demulsent in various deseases of the skin, and as a lubricant."

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nélaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receipt of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

PERFECTION SPONGE TENTS.

These Tents are the *very best in market;* in *quality of sponge, method of manufacture, strength, utility,* and *medication.*

The many complaints by the Profession against those commonly sold have encouraged the sale of the "Perfection," which will be sent in boxes of one dozen, assorted, by mail, on receipt of $2.50.

The maker holds letters of approval and recommendation from the following eminent Physicians:

J. Marion Sims, M.D., N. Y., | Washington L. Atlee, M.D., Phila.,
T. Gaillard Thomas, M.D., N.Y., | W. Byrne M.D., Brooklyn.

Address THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

Quote MEDICAL RECORD.

The attention of the medical profession is invited to this instrument as the most perfect ever invented for treating Prolapsus Uteri, or falling of the Womb. It is an Abdominal and Uterine Supporter combined.

The Abdominal Support is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen.

The Uterine Support is a cup and stem made of very highly polished hard rubber, very light and durable, shaped

to fit the mouth of the womb with openings for the secretions to pass out, and which can be sent to any curve desired, by heating in very hot water.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic, adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversion, or any Flexion of the Womb, and is used by the leading Physicians with never-failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage; or by express C. O. D.

Dr. McINTOSH'S NATURAL UTERINE SUPPORTER CO., 296 West Lake Street, Chicago, Ill.

Our valuable pamphlet, "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY.

The New York Dispensary Virus is as well-known if not better than any other Vaccine Virus in the United States, and it still continues to keep up its reputation.

Dr. N. A. Robbins succeeds Dr. Foster as Vaccine Director. Dr. Robbins is well known as a Vaccine Producer, and will maintain the standard of the Virus to its highest point. Liberal terms made with Druggists, Health Boards, and Public Institutions, etc.

Quill Slips (¼ quill charged at square cut end convex surface).....**$0.25.**
Capillary Tubes,..... **1.00.**

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Streets.; at Laboratory, 94 Pineapple Street, Brooklyn; New York Hospital, West 15th Street, and of all the leading Druggists in the City.

NEW YORK DISPENSARY, Cor. Centre and White Sts., New York.

Drs. ROBBINS & LEWIS, 94 Pineapple Street, Brooklyn. *Quote* MEDICAL RECORD

HÆMOGLOBIN,

A dry preparation of blood, which, while being perfectly soluble, will contain in a natural state all the constituents by which it differs from other fluids and tissues, has long been a desideratum among physicians.

The drinking of blood at the Abbatoirs, although the best mode of administration, is, except to a few persons, impracticable—the distance, the expense (always something), the interference of bad weather, and at times the uncertainty of obtaining the blood itself—all render this mode of treatment unsatisfactory to the patient.

Desirous of using the blood-cure for a patient some miles away from an Abbatoir, Dr. J. T. O'Connor, of this city, devised means of making from blood a *dry powder* which is *soluble*, which contains all the constituents of blood, except the serum and fibrin, and especially all the Hæmoglobin in its natural state. The success attending some months' use of this preparation has made a demand for it on the part of his professional friends; and to supply them and others who may desire to test this mode of administering blood, he has given to us the results of his investigation, and is now preparing an article for publication on this subject.

In the mean time, it is offered to the profession as a *nutrient* in simple Anæmia;—in states of exhaustion;—in all cases where Iron seemingly indicated has failed;—and as a means of presenting Iron to the organism in an *organic* state of combination;—*i. e., physiological iron.* A *true* pabulum should be, in his opinion, the result of organic process, and not merely an inorganic substance.

That this preparation is what it is stated to be, is shown by the Spectroscope—*the well-known bands of Hæmoglobin appearing in a solution of the powder so weak that it is barely tinted.*

Where liquid blood in its natural condition is preferred, we have succeeded in preserving it unchanged, and can supply it in any quantity. Yours respectfully,

CASWELL, HAZARD & CO.,
DRUGGISTS AND CHEMISTS,
Fifth Avenue, cor. 24th Street; and Sixth Avenue, cor. 39th Street, New York.

APOLLINARIS
NATURAL
Mineral Water,
THE QUEEN OF TABLE WATERS,
HIGHLY EFFERVESCENT.

DR. LEWIS A. SAYRE. "A delightful beverage—Great relief for sea sickness."
DR. WILLIAM A. HAMMOND. "Far superior to Vichy, Seltzer or any other."
DR. ALFRED L. LOOMIS. "Most grateful and refreshing."
DR. R. OGDEN DOREMUS. "Absolutely pure and wholesome; superior to all for daily use; free from all the objections urged against Croton and artificially-aerated waters."
PROF. WANKLYN, London, Eng. "Impregnated only with its own gas."
DR. P. R. PEASLEE. "Useful and very agreeable."
DR. AUSTIN FLINT. "Healthful, and well suited for Dyspepsia, and cases of acute disease."
DR. JAMES R. WOOD. "Mildly antacid; agrees well with dyspeptics, and where there is a gouty diathesis."
DR. FORDYCE BARKER. "By far the most agreeable, alone or mixed with wine; useful in Catarrhs of Stomach or Bladder and in Gout."
DR. J. MARION SIMS. "Not only a luxury, but a necessity."

To be had of all Wine Merchants, Grocers, Druggists and Mineral Water Dealers throughout the United States, and wholesale of

LÖBEL SCHOTTLÄNDER, MATTONI & WILLIE, Carlsbad, Bohemia,

Recommend to the Profession and Trade especially

CARLSBADER SPRING WATER,

AND OTHER PRODUCTS OF THE SPRING.

According to our latest contracts with the proprietors of the different Carlsbad Spring, we get fresh shipments with every steamer, so as to be able to supply this water in a quality not to be had formerly. Carlsbad Water, and especially the,

SPRUDEL,

SCHLOSS (Castle),

THERESIA,

MUEHL (Mill) SPRING,

Are to-day relied on by the Medical Profession in Germany, as the surest remedy in Diabetes, Diabetes Melitus, and Diseases of the Kidneys.

They are likewise used as a specific almost **for reducing Obesity.**

They are a mixed alkaline, saline water of reliable healing quality in Liver and Bowel Complaints, and Diseases of the Prostate Gland.

Sold, **ALWAYS FRESH,** only by us. For price and other information, please send for Pamphlet on Mineral Waters. Special Quotations on quantities.

Carlsbad Sprudel Salt may be used either to assist the effects of the Carlsbad Water or as a remedy by itself. In the latter case the dose is one or two teaspoonfuls, either in a dry state or dissolved in water.

It dissolves rapidly and completely in warm water, and in this form a curative effect may be expected with more certainty. It is advisable to use water at a temperature of 30° to 40° R. This, however, does not exclude its being taken with cold water. The best time for taking the salt is in the morning, shortly before breakfast, fasting.

CARLSBAD SPRUDEL SOAP, for Psoriasis, Eczema, and Chronic Dermatoses, always on hand.

CARLSBAD SPRUDEL LOZENGES, representing in a light degree the qualities of the water, always on hand, FRESH IMPORTED.

MY PREPARATION OF FLUID EXTRACT OF DAMIANA has now been before the profession for a term of about eighteen months. Its introduction has been retarded and injuriously affected from the fact, that several large houses in New York, not counting other concerns outside of it, have sold during all this time, so-called Damiana Extract, which is not made from the true plant, and that many physicians, who have heard favorable reports from my preparation have failed to obtain like results from other makes. I have therefore offered, and repeat it here, that I am willing to give or send (expressage unpaid) to any physician asking for it, a one ounce sample of this Fluid Extract for the sole purpose of showing at the first glance that my preparation is different from that of other makers. This is not intended to be sufficient for a physiological test, but simply as a specimen.

According to the reports, so far gathered by me, Fluid Extract of Damiana has a most decided *tonic action* on the urinary and uterine organs, and in its intensity of action, is superior to any other known remedy.

It acts with almost specific effect in *prostatitis and spermatorrhœa.* Cases of gleet that yielded to no other treatment have been cured by it. Cystitis has been very successfully treated with Damiana, and there is no drug equal to it in allaying weakness of the bladder and the frequent desire to urinate. In *nervous exhaustion* especially produced by brain labor and over work, it is superior to Quinine, and many patients who have habitually used the former derive greater and more lasting benefit from the Damiana. Several physicians have thought it incongruous that an aphrodisiac should be likewise a remedy for spermatorrhœa; but experience has shown that the tonic action of the drug is employed in curing the debility very much like the effect of morphia, which, when used where there is great pain, first subdues the pain before producing sleep, and if its powerful and lasting tonic action is considered, the effect of the Damiana as an aphrodisiac is physiologically explained. It has been given with very good effect by some of the best known Gynecologists in *Dysmenorrhœa and Leucorrhœa* although no reports have been published as yet, and it appears to be of great value in atonic ovarian diseases.

NITRITE OF AMYL PEARLS,

of 2, 3, 5, 8 and 10 drops, exactly dosed, *warranted not to burst,* made according to a new process, and largely used in *sea sickness.*

WARBURG'S TINCTURE,

pronounced by all the members of the profession as the most reliable made, and used in all cases of *Malaria, Intermittent Fevers, Ague,* and the complications arising from such cases where Quinia does not act.

1 oz. Bottles, $5 per doz., or $5 per lb.

IODOFORM CRAYONS, for ulceration of the cervix.

ERGOT CRAYONS, for uterine diseases, $1 per doz.

POWDERS OR PILLS, made by compression.

SUPPOSITORIES, made cold by compression.

BOUGIES of Tanin, Sulphate of Zinc, or any combinations made cold by compression while the *patient waits.*

F. ALFRED REICHARDT,

FOOD for INFANTS and INVALIDS

ANTILLANA.

An unmixed product from a tropical species of Canna. A light and nourishing food for Children and Invalids. Particularly adapted to Infants artificially fed, to dyspeptics and persons of weak digestion.

Pleasant to the eye and agreeable to the taste. For nursing mothers with a deficiency of milk, a bowlful taken before retiring at night will so effectually increase the secretion of milk as to save from the exhaustion consequent on the child's night nursing.

DIRECTIONS FOR USE.—As a plain food for Children and for Nursing Mothers, take a teaspoonful of the Antillana, mix into a paste with cold water, then pour over it a cupful of boiling water or boiling milk (or half milk and half water), allow it to boil for a few seconds only, and sweeten to taste. This will produce a cupful of thick, nourishing and palatable food. *See wrappers for further directions.*

Proprietor, JAMES ELMSLIE, 137 Duane Street, New York City.

PRIZE MEDAL, PARIS MARITIME EXHIBITION, 1875.

NEAVE'S FOOD

FOR

INFANTS

AND

INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and tinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.

AGENT FOR THE STATES,

A SYSTEM OF SURGERY,

THEORETICAL AND PRACTICAL,

IN TREATISES BY VARIOUS AUTHORS.

Edited by T. HOLMES, M.D.,

Surgeon and Lecturer on Surgery, St. George's Hospital, and Surgeon-in-Chief to the Metropolitan Police.

With numerous Woodcuts, Lithographs, and Chromo-Lithographs—in all four hundred and seventy-two illustrations—in five volumes octavo.

Price, in muslin binding, $45; or, in half turkey morocco, gilt top, $50.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

SHEDDEN'S FOODS FOR THE DIABETIC AND DYSPEPTIC.

The prepared Flour of Bran, freed from Starch by Camplin's process, in 10 lb. cases, $5.00. Gluten Flour, rich in nitrogenous matter and the phosphates, in 10 lb. cases, at $3.00.

SHEDDEN & CO., Broadway, cor. 34th St., New York.

HORLICK'S FOOD FOR INFANTS.

This article, as shown by analysis, is the only true substitute for Mother's Milk, and, unlike the other foods, **does not contain starch.** Infants cannot digest **starchy foods** until they have their teeth. This preparation also contains the **Phosphates** so essential for the production of bone and brain. It will **sustain life single-handed.** Requires no cooking.

We also Manufacture

HORLICK'S FOOD FOR DYSPEPTICS.

HORLICK'S FOOD FOR CONSUMPTIVES.

Price $1.00 per bottle. Trial size, 50 cents.

J. & W. HORLICK & CO., Chicago, Ills.

SUPERIOR NUTRITION THE LIFE.

IMPERIAL GRANUM.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

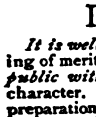
To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention. *nor been more fiercely imitated, by competition*, even to wording and shipping order.



Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,
E. HEATON,
General Agent for the United States.

SOLD BY DRUGGISTS, AND PHARMACISTS, IN THE *PRINCIPAL CITIES OF THE UNITED STATES.*

JOHN CARLE & SONS, NEW YORK.

Dr. N. Gerber's Milk-Food

Prepared in THUN, SWITZERLAND.

Many farinaceous foods prepared for children contain too much sugar and starch, while the milk added to these foods is insufficient in quantity, so that the proportion between the azote and non-azote bodies is not fairly balanced, and consequently, the children are fed in an irrational manner.

After long experimentation, in which I have sought to avoid this serious defect, I now offer an article which I believe will meet the necessity of the case, inasmuch as it contains **less starch and sugar and more milk.**

DIRECTIONS.

For children up to three months old, one part of the "Food" to eight or ten parts **cold water.** The quantity of water may be reduced for older children to four or five parts to one of "Food." After mixing well, boil it five minutes, taking care to stir it well.

CHEMICAL ANALYSES.

The composition of Dr. N. GERBER'S "Milk-Food" is stated by well-known Chemists, as follows:

THE ANALYTICAL SANITARY INSTITUTION,
LONDON, April 27, 1876.

The results of my analysis show that Dr. GERBER'S Milk-Food is composed in part of condensed milk; that it contains all the elements of a complete food, namely: the Starchy, Saccharine, Albuminous, and Mineral, in such proportions as render the food well adapted for the nutrition of infants and young children.

The amount of Nitrogenous matter and of Phosphoric Acid furnished are considerable.

The Nitrogenous matter includes 1.88 per cent of Nitrogen, and the Mineral matter 0.51 per cent of Phosphoric Acid.

ARTHUR HILL HASSALL, M.D., Chemist,
Author of "Food; its Adulterations, and the Method for their Detection."

MONTREAL, Canada, November 10, 1877.

I have satisfied myself that Dr. GERBER'S Milk-Food is not a mere "Farinaceous Food," but that it really contains, as it professes to contain, the formative elements of *Flesh, Blood and Bone;* also *Carbonaceous Matter* for the maintenance of animal heat,—thus constituting a *complete diet*, formed on the basis and type of Human Milk. * * * I can conceive of no better substitute for "Mother's Milk."

J. BAKER EDWARDS, Ph.D., D.C.L.,
Professor of Chemistry Bishop's College and College of Pharmacy, Montreal, and Public Analyst for District of Montreal, under Inland Revenue Act.

HYGIENIC PHYSIOLOGICAL INSTITUTE,
MUNICH, Sommer, 1877.

Repeated experiments of Dr. GERBER'S Milk-Food, made by D. Med. FR. RENK, Assistant of Privy Counsellor Prof. Dr. MAX VON PETTENKOFER, at his Laboratory; also, at Prof. Dr. C. VOIT'S Physiological Institute in Munich, show the average analysis to be:

Water,	4.31 per cent.
Mineral Salts,	2.03 "
Fats,	5.23 "
Albuminates,	15.51 "
Hydro-Carbons, soluble,	48.41 "
" " insoluble,	24.46 "
	99.95 "

This preparation is highly recommended by:

Prof. DEMME, Physician to the Jenner Hospital for Children Berne, Switzerland.

Dr. J. RUD. SCHNEIDER, Sup't of the Hospital of the Canton Berne, Switzerland.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 18, 1878, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Second of October, 1878, and end about the 1st of March, 1879.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge*.

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Practical Anatomy Fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures upon special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consist chiefly of Recitations from Text-Books. This term continues from the first of March until the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the Faculty. Regular clinics are also given in the Hospital and in the College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	25 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

MEDICAL BOOKS.

When you want any Medical Books, or any information concerning them, write to

WM. WOOD & CO., Publishers and Dealers in Medical Books,
27 Great Jones Street, New York.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast,

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case $9 00
Quarts, 2 dozen in a case 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case $8 00
Quarts, 2 dozen in a case 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

Instruction, Retreats, Private Hospitals, &c., ,&c.

TO ADVERTISERS.—Cards inserted, under the above headings, at the rate of 20 cents per line, column width, Nonpareil type. *No Advertisements taken for less than Ten Lines.*

WANT TO EXCHANGE:

1st.—Wales' Objectif, 1-15 inch, new.

2d.—Complete set of "Braithwaite's Retrospect," the whole 74 parts, bound in 34 vols., half sheep, or parts of them, for either Surgical Instruments, Electrical Machine, or Medical Books.

J. S. CARREAU, M.D., 135 Macdougal Street.

DR. GEO. C. S. CHOATE

Continues to receive cases of Mental and Nervous Disease, at his residence in

PLEASANTVILLE, WESTCHESTER CO., N. Y.

Application for admission may be made to Dr. Choate by mail, at Pleasantville, or personally, at his Office, 10 East 28th St., New York, on Mondays, Wednesdays, and Fridays, between 11 A.M. and 1 P.M.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.

Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings, and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases*, *Dipsomania* and *Opium Habit*, and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 159d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR. EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum.

THE PRIVATE INSTITUTION FOR

FEEBLE-MINDED YOUTH,

AT BARRE, MASS.,

Established June, 1848.

Offers to parents and guardians, superior facilities for the improvement of this class of persons, and the comforts of an elegant country home. A few cases of *Insanity*, of mild type, have always been received.

GEO. B. BROWN, M.D., *Superintendent.*

SHADY LAWN,

GOTHIC STREET, NORTHAMPTON, MASS.

ENLARGED NOVEMBER, 1876.

A MEDICAL HOME FOR INVALIDS:

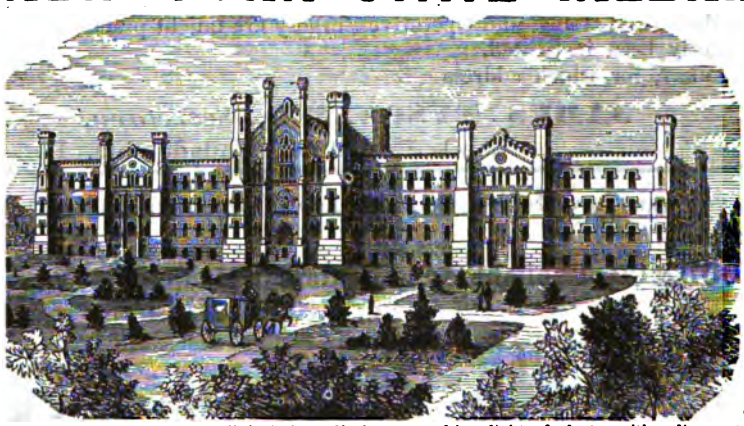
Diseases of the Mind and Nervous System;
Medical and Surgical Treatment of Ailments of Women.
The Alcohol and Opium Habits.

A. W. THOMPSON, A.M., M.D. (CANTAB.)

Formerly of Northampton Lunatic Hospital. Ex-President Hampshire Medical Society.

NEW YORK STATE INEBRIATE ASYLUM,

Binghamton, Broome County, N. Y.



This Asylum is admirably situated, overlooking a fine section of country, and is complete in all the appointments of a first-class home, with ample means to meet the wants of every case. It is located three miles from the city, and removed from all temptation. Its management is the same as all other State charities under the control of a Board of Managers appointed by the Governor. The law provides for the maintenance of indigent inebriates, similar to that of the insane, but patients from other States may be admitted.

The experience of this Asylum, for the past ten years, indicates an increasing usefulness and necessity for such institutions, and the original intention of making this an Asylum Hospital, where this disorder may be thoroughly understood and treated on broad scientific principles is nearer realized than ever before. All rules are strictly enforced, and no patient permitted to go beyond the Asylum grounds without permission from the Superintendent, or in the care of an attendant.

The Charges for Board will include medical care, washing, lights, fuel, etc., with ordinary attention. The exigencies of each particular case will be acted upon, as it may present itself, to those of moderate and limited means as well as the rich.

All inquiries and applications for admission should be addressed to the Superintendent.

DANIEL H. KITCHEN, M.D., Superintendent,
Binghamton, Broome Co., N. Y.

WILLARD PARKER, M.D., New York, N. Y.,
President Board of Managers.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

By SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adults."—DR. DESSEAU *in Medical Record, July 28, 1877.*

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

SENT BY MAIL, POSTPAID, ON RECEIPT OF PRICE.

THE ELEMENTS OF THERAPEUTICS.

A CLINICAL GUIDE TO THE ACTION OF MEDICINES.

By DR. C. BINZ, Professor of Pharmacology in the University of Bonn.

Translated from the Fifth German Edition, and edited, with additions, in conformity with the British and American Pharmacopœias.

By EDWARD I. SPARKS, M.A., M.B., Oxon, Member of the Royal College of Physicians of London, Officier de Santé (Alpes Maritimes), France, formerly Radcliffe Travelling Fellow.

In one handsome 12mo volume, bound in extra muslin, price $2.00.

QUAIN'S ELEMENTS OF ANATOMY.

THE EIGHTH EDITION.

Re-edited by WILLIAM SHARPEY, M.D., LL.D., F.R.S., L. & E., Emeritus Professor of Anatomy and Physiology in University College, London; ALLEN THOMSON, M.D., LL.D., F.R.S., L. & E., Professor of Anatomy in the University of Glasgow; and EDWARD ALBERT SCHÄFER, Assistant Professor of Physiology in University College, London.

Illustrated by upwards of 950 Engravings on Wood.

Two vols. 8vo. Bound in Cloth. Price $12.00.

LECTURES ON FEVERS.

By ALFRED L. LOOMIS, A.M., M.D.

In one handsome octavo volume. Cloth, $4.00; Sheep, 4.75.

Sent by Mail, post-paid, on receipt of price.

STUDIES IN PATHOLOGICAL ANATOMY.

By FRANCIS DELAFIELD, M.D., Adjunct Professor of Pathology and Practice of Medicine in the College of Physicians and Surgeons; Visiting Physician and Pathologist of the Roosevelt Hospital; Visiting Physician and Curator of Bellevue Hospital.

In Royal Octavo Parts, each containing from two to four full-page Lithographic Plates in tint, and in color, with accompanying explanatory text.

☞ These studies will form, when completed, a treatise on Pathological Anatomy of exceptional value, especially for the remarkable fidelity of the illustrations, their minute and elaborate detail. The Parts will be published regularly, the first of each month, and sent to subscribers carefully rolled, to protect the Plates from injury.

Subscription Price, $5.00 a Year. Single Numbers, 50 cents. Invariably in advance.

☞ *Specimen Copies will be sent on receipt of 50 cents.*

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

TAMAR INDIEN

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution,** which is generally preferred; or of an **elixir,** when a slight stimulant is desired.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

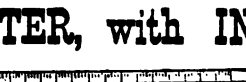
The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

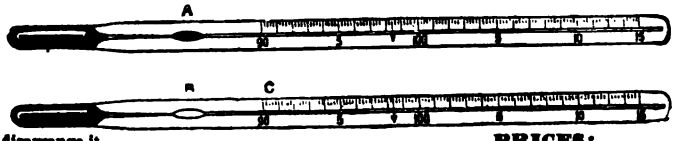


Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

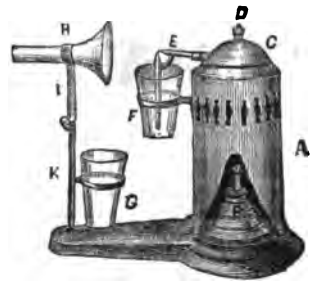
No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

E. FOUGERA & CO., Agents, 30 North William St.. New York.

F. G. OTTO & SONS'

STEAM ATOMIZER.



A is a cylinder (made of Russian iron) for the reception of a copper-bottom boiler, C, and an Alcohol lamp, B. D is the safety-valve, E the Glass spray tube, F the medicine cup, H the face shield, I is a split tube which slides on the upright K, by means of which the face shield may be lowered or raised at will. G is a glass cup, and serves as receiver for the drippings of the face shield.

DIRECTIONS FOR USE.

Unscrew the valve D, fill the boiler to about three-quarters of its capacity with water, and screw the valve D on securely; then light the Alcohol lamp B. When sufficient steam is generated, it will pass through the horizontal part of spray tube and blow over the perpendicular part, which will then suck up the medicine from the cup F, and will produce a very fine spray.

In placing this Steam Atomizer before the profession and public, we have tried and succeeded to make a perfect and at the same time a cheap and reliable instrument.

Price, $4.00.

F. G. OTTO & SONS,

MANUFACTURERS AND IMPORTERS OF

Surgical Instruments and Orthopedical Appliances,

64 Chatham Street, New York.

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material, the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's and all other shapes. *Manufactured only by*

F. G. OTTO & SONS, 64 Chatham Street, New York.

NOTICE.

It will please many of our readers to know that the firm of Hegeman & Co., whose failure we noticed in January, have again resumed their business. Mr. Geo. B. Marcher, who for twenty years had charge of the wholesale and manufacturing business of the establishment, has been associated with the concern, and the business will again be carried on as before, at 203 Broadway.

Editorial "New Remedies," April Number.

HEGEMAN'S
STANDARD
PREPARATIONS.

CORDIAL ELIXIR OF CALISAYA BARK, a pleasant and agreeable Tonic for dyspepsia, etc.; for persons living in Fever and Ague districts, it will be found invaluable as a preventive.

FERRATED ELIXIR OF BARK, the most perfect Iron Tonic; a pleasant cordial, containing the active principles of Calisaya Bark and Iron.

TOLU AND LIVERWORT EXPECTORANT, a speedy and certain cure for coughs, hoarseness, and all diseases of the throat and lungs.

GENUINE MEDICINAL COD LIVER OIL, for Consumption, Scrofula, Rheumatism, etc. Our Oil has stood the test of twenty years, and thousands of patients attribute their recovery to its use. It is warranted pure.

NUTRITIVE TONIC.

BEEF, WINE AND IRON.—Our *Nutritive Tonic* is prepared from Extract of Beef, Pure Sherry Wine, and Citrate of Iron, combined with a pleasant form; and, in all cases where an efficacious Tonic is desired, it will be found a most valuable preparation. It is extensively used in all sections, and highly recommended by the most eminent physicians.

HEGEMAN'S
COD LIVER OIL AND LIME.

The name of this Compound of Medicine is undoubtedly well known to very many; in fact, the combination of the Genuine NEWFOUNDLAND Cod Liver Oil and Phosphate of Lime, as prepared by us, has a world-wide reputation as the most potent remedial agent in the treatment of that scourge of our country—Consumption—and more prevalent in our climate than any other section in the world.

We have spared neither pains nor expense in the manufacture of this preparation, and its superior quality is shown in the fact that wherever it has been introduced it has superseded all others.

CHAPPED HANDS AND FACE,

Sore Lips, Dryness of the Skin, &c., &c.,

Cured at once by HEGEMAN'S CAMPHOR ICE WITH GLYCERINE. It keeps the hands soft in all weather. See that you get HEGEMAN'S Sold by all Druggists. Price 25 cents; sent by mail for 30 cents.

MANUFACTURED ONLY BY

Hegeman & Co., Chemists & Druggists, 203 Broadway, N.Y.

SAMUEL G. WEBBER, M.D., and JAMES J. PUTNAM, M.D., *in Diseases of the Nervous System.*

Persons who hold no degree in arts or science must pass an *examination for admission* to this School, in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held June 24th, both at Boston and at Cincinnati; on September 23d, at Boston only.

Instruction is given by lectures, recitations, clinical teaching, and practical exercises, distributed throughout the academic year. The year begins Sept. 26, 1878, and ends on the last Wednesday in June, 1879. It is divided into two equal terms, either of which is more than equivalent to the former "Winter Session," as regards the amount and character of the instruction. The course of instruction has been greatly enlarged, so as to extend over three years, and has been so arranged as to carry the student progressively and systematically from one subject to another in a just and natural order. In the subjects of anatomy, histology, chemistry, and pathological anatomy, laboratory work is largely substituted for, or added to, the usual methods of instruction.

Instead of the customary oral examination for the degree of Doctor of Medicine, at the end of the three years' period of study, a series of written examinations on all the main subjects of medical instruction is held at the end of each year; and every candidate for the degree must pass a satisfactory examination in every one of the principal departments of medical instruction during his period of study.

DIVISION OF STUDIES.

For the First Year.—Anatomy, Physiology, and General Chemistry.

For the Second Year.—Medical Chemistry, Materia Medica, Pathological Anatomy, Clinical Medicine, Surgery, and Clinical Surgery.

For the Third Year.—Therapeutics, Obstetrics, Theory and Practice of Medicine, Clinical Medicine, Surgery, and Clinical Surgery.

Students are divided into three classes, according to their time of study and proficiency. Students who began their professional studies elsewhere may be admitted to advanced standing; but all persons who apply for admission to the second or third year's class must pass an examination in the branches already pursued by the class to which they seek admission. The examinations are held in the following order:—

At the end of the first year—Anatomy, Physiology, and General Chemistry.

End of second year—Medical Chemistry, Materia Medica, and Pathological Anatomy.

End of third year—Therapeutics, Obstetrics, Theory and Practice of Medicine, Clinical Medicine, Surgery, and Clinical Surgery.

Examinations are also held before the opening of the School, beginning September 23d.

REQUIREMENTS FOR A DEGREE.—Every candidate must be twenty-one years of age; must have studied medicine three full years, have spent at least one continuous year at this School, have passed the required examinations, and have presented a thesis.

COURSE FOR GRADUATES.—For the purpose of affording to those already Graduates of Medicine additional facilities for pursuing clinical, laboratory, and other studies, in such subjects as may specially interest them, the Faculty has established a course which comprises the following branches: Histology; Physiology; Medical Chemistry; Pathological Anatomy; Surgery; Auscultation, Percussion, and Laryngoscopy; Ophthalmogy; Dermatology; Syphilis; Psychological Medicine; Otology; Electro-therapeutics; Gynæcology; and Obstetrics. On payment of the full fee the privilege of attending any of the other exercises of the Medical School, the use of the laboratories and library, and all other rights accorded by the University will be granted. Single branches may also be pursued. Graduates of other Medical Schools who may desire to obtain the degree of M.D. at this University will be admitted to examination for this degree after a year's study in the Graduates' Course. Examination on entrance not required.

FEES.—For Matriculation, $5; for the Year, $200; for one term alone, $120; for graduation, $30. For Gradnates' Course, the fee for one year is $200; for one Term, $120; and for single courses such fees as are specified in the Catalogue. Payment in advance.

Members of any one department of Harvard University have a right to attend lectures and recitations in any other department without paying additional fees.

For further information, or Catalogue, address

DR. R. H. FITZ, *Secretary,*
108 Boylston Street, Boston, Mass.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia.....1-60 gr.	**Mercury, Proto-Iodide**....1-5, 1-4, 1-2 gr.
Arsenious Acid.....1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**.....1-8, 1-4 gr.
Atropia.....1-60 gr.	**Morphia, Sulphate** 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract.....1-4 gr.	**Morphia, Valerianate**..... 1-8 gr.
Calcium, Sulphide.....1-10 gr.	**Podophyllin**.....1-8, 1-4 gr.
Codeia.....1-16, 1-5 gr.	**Quinia**.....1-2, 1-4 gr.
Corrosive Sublimate....1-40, 1-30, 1-20 gr.	**Strychnia**.....1-60, 1-40, 1-30 gr.
Digitalia.....1-60 gr.	**Sulphur, Iodide**.....1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.	**Tartar Emetic**.....1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass, $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. "Successfully used for Dyspepsia, Diarrhœa and Female Complaints."—Prof. Sam'l Jackson, M.D., Univ. of Penn. "Invaluable for Neuralgia and Nervous Diseases."—Geo. T. Harrison, M.D., Woman's Hospital, N.Y. "Unequaled for diseases peculiar to females."—John P. Metteaer, M.D., LL.D., of Va. "Specific for Scrofulous and Cutaneous Affections."—J. M. Allen, M.D., of N. C. "Excellent Tonic Alternative and Diuretic—one of Nature's greatest remedies."—Medical Asso. of Va., Lynchburg. Address, **A. M. DAVIES, Prest. of the B. A. & I. S. Co., Lynchburg, Va.**

Sold by CASWELL & MASSEY, New York City.

GARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal; Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Coffein, ½ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-5 grain; Crotors Chloral (Liebreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascardium; Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ¼ grain Extr. Nux Vomica; Extr. Gilsemium; Drag. Meglin; Quin. and Ferri Citras, (20% Quins.) 2 grains; Tonic Aperient; also the already well-known Granil Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Avenue.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIG'S Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

Original Lectures.

LECTURES ON THE LOCALIZATION OF SPINAL AND CEREBRAL DISEASES.*

By E. C. SEGUIN, M.D.,

CLINICAL PROFESSOR OF DISEASES OF THE MIND AND NERVOUS SYSTEM IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

LECTURE III.

1. SYSTEMATIC DISEASES OF THE SPINAL CORD, CONTINUED; LESIONS IN THE KINESODIC SYSTEM. 2. NON-SYSTEMATIC OR FOCAL LESIONS OF THE SPINAL CORD; LESIONS AT DIFFERENT HEIGHTS IN THE ORGAN.

GENTLEMEN:—There remain for consideration a few of the systematic lesions of the spinal cord.

4. Myelitis of the anterior horns, or poliomyelitis anterior. Like all affections of the kinesodic tract, this affection is characterized by the predominance of motor symptoms and the absence of sensory ones. But we also meet with great trophic changes—muscular atrophy—in this disease.

The lesion consists, as we know from the autopsies by Gombault, by Cornil and Lépine, and by Déjérine, in an inflammation of the anterior gray horns of the spinal cord, leading to atrophy, and even destruction of the motor (and trophic?) ganglion-cells. The change in the cells is acute pigmentary degeneration.

In those regions of anterior gray matter corresponding to the paralyzed parts, hardly any motor ganglion-cells remain. Other lesions are degenerative changes in the motor nerves, as far as their termination, and muscular atrophy, usually without fatty metamorphosis.

The symptoms of the affection vary in the three varieties: acute, sub-acute, and chronic.

a. In acute febrile poliomyelitis anterior we observe a sharp, remittent or continued fever, lasting one or several days, accompanied in many cases by pains in the limbs, and sometimes by slight numbness. This is followed, suddenly, as a rule, by extensive paralysis, the fever ceasing. The paralysis may affect all the limbs, or two of them, or one only; it tends to diminish spontaneously to a marked extent. No anæsthesia is present, and but little numbness. Reflex movements are reduced or abolished, the bladder and rectum act normally, and there is no tendency to bedsore. But other, even more characteristic symptoms, soon follow. In a few days the nerve-trunks in the severely palsied limbs lose their galvanic and faradic excitability, and the muscles, while ceasing to respond to the faradic current, contract slowly, and with abnormal formula, to the galvanic current—we have the degeneration-reaction. A little later, after two or three weeks, the palsied muscles undergo rapid atrophy, an atrophy which is progressive if no recovery is to take place. Ultimately only one muscular group may remain paralyzed and atrophied.

b. There is a non-febrile acute myelitis anterior. The patient, usually a child, is put to bed well, and awakes in the morning with one or more paralyzed limbs, with the subsequent symptoms as above.

In these two forms are to be ranged nearly all cases of infantile spinal paralysis so-called, and many cases of the same disease occurring in the adult.

c, d. Febrile and non-febrile subacute myelitis of the anterior horns differ from the above only in degree of acuteness and in rapidity of development, and need no detailed description.

e. Chronic myelitis of the anterior horns is often mistaken for progressive muscular atrophy; yet a diagnosis, is, I think, frequently possible. Often in this variety of poliomyelitis there occur severe neuralgic pains in the limbs which are to undergo palsy and wasting. These phenomena, when they appear, weeks or months after the first symptoms, attack whole muscular groups at once, and we do not observe the fibrillary or fascicular wasting of progressive muscular atrophy. The reactions are like those found in the acute and subacute form. No anæsthesia appears. This rare form has been observed in children and in adults.

It is only very recently that we have had a correct knowledge, clinical and pathological, of myelitis anterior. Prior to 1865, infantile spinal paralysis, though well known clinically (Heine, 1840), was thought to be due to congestion of the spinal cord, etc.; but in that year Prévost, working with Charcot, discovered the lesions in the anterior horns, and since numerous autopsies have yielded the same results. As regards the disease in the adult, it was correctly observed and classified as far back as 1847 (Duchenne), and in subsequent years by Charcot and others. Its pathological anatomy was not discovered until 1873 (Gombault) and 1875 (Cornil and Lépine). Although we need more light upon the intimate nature of the pathological changes occurring in this disease, I believe it to be now quite firmly established in nosology. Its diagnosis should be readily made by all practitioners.

5. Degeneration of the ganglion-cells of the anterior horns. As indicated by the name, the lesion in this affection is degenerative rather than inflammatory. This is true in the sense that changes in the neuroglia are wanting as a rule, and that the molecular death of the ganglion-cells takes place very slowly. This is in marked contrast to the suddenness and extent of the lesion in No. 4. Ganglion-cells are found in every stage of transition from simple increase of normal granular contents to mere roundish masses of granules—granular bodies; in some parts of the anterior horns not even vestiges of cells remain.

The symptoms of this lesion are fibrillary contractions followed by atrophy. Sensory symptoms are wholly wanting as a rule, and in a few cases the wasting limbs are the seat of some neuralgic pains. There is at no time a true paralytic condition, since the loss of power is precisely in proportion to the destruction of muscular tissue.

The mode of occurrence of the atrophy deserves a remark. Whole muscles or muscular groups do not waste away rapidly as in No. 4, but the muscular tissue undergoes change, bundle by bundle, very slowly. It thus happens that we see one or two large fasciculi in a muscle quite atrophied, while the adjacent fasciculi of the same muscle are normal, or only show fibrillary contraction. Several months may elapse before a muscle be wholly atrophied. Another feature of the atrophy is that it attacks by preference certain muscular groups, as those of the hand, chest, thighs, etc. It also affects simultaneously, or nearly so, parts which are symmetrical and homologous. If we examine the wasting muscles with the faradic current, we obtain yet another diagnostic sign: in this affection reaction to the faradic current is lost only in the absolutely atrophied muscles or parts of muscles. This loss of reaction is in direct proportion to the atrophy, whereas, in myelitis of the anterior horns

* Delivered at the College of Physicians and Surgeons during the months of December, 1877, and January, 1878.

whole muscles and muscular groups lose their faradic reaction *en masse*, and this, too, often before any marked degree of wasting has appeared. By the latter test, by the distribution of paralysis and atrophy, and by the predominance of neuralgic pains in chronic myelitis of the anterior horns, we may nearly always distinguish it from progressive muscular atrophy. Of course, the two diseases are congeners, and their pathological relationship may even be closer than we now suspect.

Cruveilhier, Aran, Duchenne, and Roberts admirably described the clinical aspects of this disease, and its naked-eye pathological anatomy. But it is to the very recent labors of Lockhart Clarke (1861–2), and of Charcot and his pupils, that we owe the exact determination of the lesion in the anterior horns of the spinal cord. It is also only within the last ten years that we have clearly distinguished pure muscular atrophy from the various forms of symptomatic atrophy.

6. Central myelitis. An inflammation of the central parts of the spinal gray matter, involving the æsthodic and kinesodic tracts, extending in some cases throughout the whole length of the organ. The proliferative changes and exudations result either in the formation of a central plug, or the development of a cavity, which is filled with clear fluid. The anterior horns and the various columns of the spinal cord are more or less involved through extension of inflammatory action, or by compression. As might be inferred from the above, the symptomatology of the affection is obscure and complex. Early in the disease, disorders of sensibility—as numbness, formication, and pain, followed by anæsthesia—are prominent. Irregularly distributed paralysis, with or without atrophy, is also present. The diagnosis in this early stage, which may last years, is next to impossible. When the disease is fully formed, we have quite a distinct symptom-group. The arms alone are sometimes paralyzed, atrophied, and anæsthetic, while the legs are the seat of abnormal reflex, even to the degree of tetanoid walk. In other cases we see a general paralysis and universal anæsthesia, with contracture of some muscular groups, paralysis of the bladder, and the appearance of bed-sores. If the cervical enlargement be the seat of diffused central myelitis, pupillary symptoms are seldom wanting, and the pulse is accelerated. The disease is eminently a chronic one, years being required for its full development.

Historical considerations.—Ollivier (1836) observed and described central myelitis with formation of cavities, but not much was learned of the disease and its semeiology until Schüppel published his paper (Ueber Hydromyelus) in 1865. Hallopeau, in 1871–2, contributed a series of elaborate articles upon the subject to the *Archives Générales de Médecine*, and in the last few years Westphal and Leyden have paid considerable attention to this rather rare form of disease.

2.—NON-SYSTEMATIC OR FOCAL LESIONS OF THE SPINAL CORD; LESIONS AT DIFFERENT HEIGHTS IN THE ORGAN.

A variety of lesions may involve the whole or a large part of the spinal cord at a given level, extending transversely through its various columns. These are focal lesions, and chief among them we find: injuries of all kinds; compression by bone or by a tumor; transverse sclerosis; transverse softening; hemorrhage in cord; tumor in the cord, etc.

The nature of the lesion is sometimes such (fracture of vertebræ) as to indicate at once the seat of injury to the spinal cord; but in many cases the peculiarity in the symptoms is not due to the nature of the lesion, but to its location high up or low down. The diagnosis of this location is possible only by the aid of anatomical and physiological knowledge.

The following diagram, made from data furnished by Malgaigne, may assist in estimating the height of a lesion. It indicates the point of origin of the important nerves and plexuses, and the seat of so-called centres relatively to the spinous processes of the vertebræ.

In general terms, we may say, that these focal lesions give rise to paralysis, numbness and anæsthesia, to modifications of the reflex function, usually an increase; that they cause paresis or paralysis of the bladder and the sphincter ani, and that they set up a great liability to bed-sores. This general sketch varies greatly from that of the symptoms of any of the systematic spinal lesions, except No. 6, central myelitis. This great dissemblance is a necessary result of the difference in the location of lesions; focal lesions involving kinesodic, æsthesodic, and trophic parts of the cord, and cutting off the inhibitory action of the encephalon (Setschenow), upon the spinal cord.

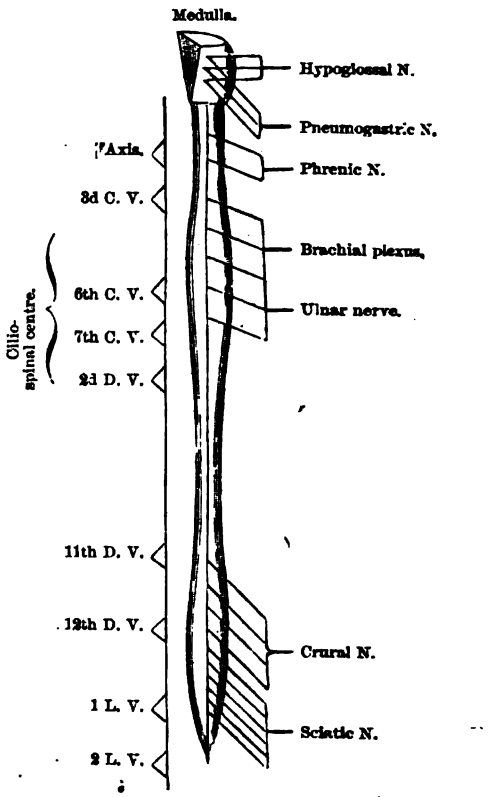

FIG. 4.

Relation of spinous processes of vertebræ to spinal nerves. After Malgaigne, *Traité d'Anatomie Chirurgicale*, vol. ii., pp. 82–3.

I shall attempt to make clear to you the diagnosis of lesions placed (1) in the lower lumbar enlargement; (2) just above the lumbar enlargement; (3) in the mid-dorsal region; (4) in the cervical enlargement, and (5) in the upper cervical region.

1. Focal, transverse lesions in the lower part of the lumbar enlargement. The motor symptoms produced by such a lesion are paralysis of the muscles innervated by the sciatic nerve—those of the feet, legs, posterior aspect of the thigh and the nates. The sphincter ani will be weak or paralyzed; the bladder unaffected. The reflex movements of the paralyzed

muscles are reduced in force, or absolutely wanting; wanting if the whole of the gray matter in the lower end of the cord is diseased in such a way as to destroy its functions. Dependent also upon this extent of lesion downward, is the state of muscular irritability. If the condition be as just described, the paralyzed muscles undergo atrophy, and lose their faradic contractility. The sensory symptoms are various; at the beginning of the disease (often before paresis) there is numbness in the soles of the feet, without anæsthesia. Later the numbness may appear in the whole foot, the calf, the posterior aspect of the thigh, and actual anæsthesia may supervene. If the soles of the feet lose their sensibility, the patient is no longer able to maintain his equilibrium when his eyes are closed. Another sensory symptom of importance is the cincture or band feeling, which, whether like a cord or like a belt round about the palsied parts, indicates (in accordance with the distribution of sensory nerves) the upper limit of the spinal lesion. Thus, in the condition we now study, the cincture feeling will not be about the waist or groin, but around the ankle, leg, or thigh. The above symptoms make up an incomplete paraplegia.

2. Focal, transverse lesions, situated just above the lumbar enlargement. Conduction to and from the brain is interfered with, but the gray matter of the lumbar enlargement retains its functional activity in great measure; hence we have a very different semeiology from that described above. In addition to weakness in the feet, there is developed a more or less complete paralysis of the whole of the lower extremities, from the pubis down. The rectum and bladder are paralyzed, the latter showing defective action by slow, interrupted micturition, or by retention, while constipation expresses the rectal paresis. The reflex movements of the paralyzed limbs are usually exaggerated, sometimes enormously so. This increase in reflex movements gives rise to the combined tonic and clonic movements of the paralyzed limbs, which Brown-Séquard years ago designated spinal epilepsy. This often seems spontaneous, when the patient is in bed for example, but it is certain that peripheral irritations, whether from the contact of the bed-clothing or from fæces in the rectum, urine in the bladder, etc., always precede and cause it. The preservation and increase of reflex is owing to the continued (increased) activity of the lumbar gray matter below the lesion, and the cessation of cerebral inhibitory action. Dependent upon the former fact also, we observe that the paralyzed muscles do not undergo positive atrophy, and that their electrical reactions are normal or exaggerated. Erections occur, and coition may be accomplished in these cases and in those to be described in the next paragraph.

As regards sensory symptoms we have, as in No. 1, numbness and anæsthesia in the paralyzed parts, extending as high upward as the groins or waist. The cincture feeling is nearly always present, and is placed by the patients round about the body at the level of the hips, or waist just below the umbilicus. In some cases the cincture is incomplete, and the feeling is likened to a firm grip in the patient's side or hip. The above description is a picture of common, complete paraplegia.

3. Focal, transverse lesions in the middle or upper dorsal region. The motor and sensory symptoms produced by a lesion so placed are very similar to those just described, with the following additions. The abnormal reflex movements are often more marked than in No 2, and the cincture feeling, index of the upper limit of the lesion, is placed at or above the umbilicus, around the lower ribs, or even just under the arms. In this condition the rectum and bladder may after a while partly regain their functions; *i. e.*, their contents are involuntarily expelled from time to time by reflex action.

If the urine dribbles away it is not because the "sphincter" (?) of the bladder is paralyzed, but because there is retention and overflow—a state demanding the daily use of absolutely perfect and carbolized soft catheters. In the earlier stages of the affection, the occurrence of increased reflex action in the paretic limbs gives rise to a tetanoid state during attempts at standing or walking, and too hasty, quasi-involuntarily micturition and defecation. Later in the disease the paralyzed limbs may become contractured, by reason of secondary changes in the lateral columns.

4. Focal, transverse lesions in the cervical enlargement. According as the lesion suddenly or gradually affects the whole of the cord transversely, or according as it is placed on the lower or upper portions of the enlargement, somewhat different symptoms are obtained. They always, however, bear a general resemblance to those in Nos. 2 and 3.

a. A partial lesion may for a time produce symptoms, numbness and paresis, in the arms and hands alone, the lower limbs being only weak and showing increased reflex. Later, as the lesion extends, the legs as well as the arms are paralyzed, and the cincture feeling exists high up.

b. A lesion involving the cord at the level of the eighth cervical and first dorsal nerves (see sketch) will give rise to paralysis, often with atrophy and loss of faradic reaction in those muscles of the upper extremities which are animated by the ulnar nerves, *i. e.*, nearly all the small muscles of the hands, and some of the flexors of the wrist and fingers. There will be sensory symptoms in the same district; and the cincture feeling, if present, will be across the upper part of the chest. The lower extremities are paretic or wholly paralyzed, numb or anæsthetic, according to the completeness of the destruction of the spinal tissue. In severe cases nearly all the intercostal muscles will also be paralyzed, and thus life will be much more jeopardized than by lesions placed lower down. The danger is all the greater because the expiratory muscles (intercostals, triangularis sterni, abdominal muscles) are paralyzed also.

c. If the lesion be situated in the upper part of the enlargement, the motor and sensory symptoms will be apparent in nearly the whole of the upper extremities, as well as below them. The reflex capacity, the state of bladder and rectum, the faradic reactions of muscles remain substantially as in Nos. 2 and 3. The cincture feeling is referred to the level of the clavicles, or a little lower, across the chest and the arms below the deltoid. The difficulty of breathing is even greater than in *b*. The symptom-groups produced by lesion No. 4 are often designated by the names of cervical paraplegia, or general paralysis.

In case of lesion in any part of this region (from the level of the fourth dorsal to that of the fourth cervical nerves) there may be pupillary and facial vaso-motor symptoms. If the lesion be of such a nature as to cause irritation of the cilio-spinal centre, the symptoms are dilatation of the pupils and pallor of the face, while if there be a loss of the activity of the cilio-spinal centre, the pupils are small and the face and ears flushed and hot. It must be added that these vaso-motor and ciliary symptoms are not by any means as frequently observed as theory and experimentation would lead us to expect.

The same may be said with reference to some pecu-

liarities in the action of the heart and variations in the bodily temperature which have been observed. In severe traumatic lesions in this region, we often find retardation of the pulse, and great elevation of the temperature of paralyzed parts.

5. Focal, transverse lesions in the upper cervical region. These, like No. 4, produce cervical paraplegia, but a much more complete one. The patient is wholly paralyzed below the head, and the entire body may be anæsthetic. Of necessity the phrenic nerves are paretic or paralyzed, according to the completeness of the injury to the cord, and life is almost immediately terminated by asphyxia. Cases of this category are nearly always of a surgical character; non-traumatic lesions of this region being exceedingly rare. There may be ciliary and facial vaso-motor symptoms here as in No. 4, and the bodily temperature and pulse-rate are variable, Life is preserved too short a time to allow of much study of these symptoms. In slowly developed lesions we may have phenomena of irritation, as hiccough, dyspnœa, acceleration of the pulse, together with paretic symptoms in the arms and chest, later in the legs.

THE SYMPTOMS AND TREATMENT OF IRREDUCIBLE HERNIAS.

A Lecture

Delivered before the Medical Class of the University of Pennsylvania.

By D. HAYES AGNEW, M.D.,

PROFESSOR OF SURGERY AND CLINICAL SURGERY IN THE UNIVERSITY MEDICAL SCHOOL.

(Reported for The Medical Record.)

The cause which renders a hernia irreducible differs in different cases. It may be (1) an adhesion between the sac and its contents, or (2) an adhesion between the omentum and intestine in the sac, or (3) the irreducibility may depend upon changes which have taken place at the neck of the sac, it being thrown into folds which become glued together, and cannot be straightened out. In omental hernias the sac becomes indurated and altered, so as not to resemble a serous membrane.

In the general treatment of irreducible hernias, you must adjust yourselves to the conditions of the case. Give general directions and apply some kind of restraining apparatus to keep more intestine from coming down. Particular attention should be paid to three points. 1. No articles of food causing flatulence should be allowed. 2. Fæces must not be permitted to accumulate. 3. The patient should not attempt to lift any heavy weights.

Of course the hernial mass tends to increase rapidly in size. 1. If it is large, use a suspensatory bag, and buckle it up tight. 2. If the hernia is small, it will be best to have a concave pad made, or to take a hard rubber pad and mould it into the proper shape by warming it. The pad should always be a little larger than the tumor. In every case be careful to put some cotton between the pad and the skin. If the adhesions are very recent you may be able to break them up by gradual pressure. So much for general treatment. Let us now consider the treatment of special forms. Irreducible hernias may be divided into those which are *temporarily*, and those which are *permanently* irreducible.

THE SYMPTOMS AND TREATMENT OF TEMPORARILY IRREDUCIBLE HERNIAS.

There are a variety of causes which may render a hernia temporarily irreducible. The patient may have left off his truss for a time, or he may never have found any difficulty in restoring the hernia, and so never have been obliged to use a truss. Upon some occasion he finds that he is suddenly seized with a feeling of great discomfort. He tries to reduce the hernia and fails. The tumor is swollen and enlarged. There is some nausea and tympanitic distention of the bowels. He sends for the physician, who finds that the hernia has become irreducible, by reason of the entrance of air, or of fæces into the sac.

Nothing being more grave than a strangulated hernia, what is the physician to do in such a case? If the tumor be large and tender, be very careful how you manipulate it. The first thing to be done, of course, is to find out the cause. If the irreducibility is due to the distention of the sac by air, or fæces, try to dislodge the sac's contents. Place the patient on his back, elevate the shoulders, flex the thighs on the abdomen, and institute gentle compression over the region of the tumor. Make this pressure with a great deal of care and very gradually. By the end of fifteen minutes or so, you may feel a little yielding, and hear a slight gurgling sound. That is always a presage of ultimate success.

If this gentle compression is followed by no good results, stop it and try something else. If it is an inguinal hernia, place some leeches over the course of the spermatic cord; if femoral, put them above the saphenous opening, and apply a cold-water dressing. Very often a large injection of flaxseed tea and turpentine will work wonders. The belly will subside and the tumor disappear. But you cannot cure all cases quite so readily. What then shall you do? Let the patient remain quiet on his back, and give the following prescription:

℞.

Pulv. opii	gr. j.
Ext. belladonnæ	gr. ss.
Ext. aloës,	
Pulv. rhei	ää gr. ij.

M. Et in pil. No. IV. divide.
Signe. One pill every hour.

Keep the cold-water dressing over the parts. In the course of eight hours give an injection, and the hernia will probably disappear. Sometimes a hernia will disappear spontaneously. In cases where the stomach will retain anything, castor oil in doses of two teaspoonfuls should be given every two or three hours as a cathartic.

THE SYMPTOMS AND TREATMENT OF STRANGULATED HERNIAS.

Strangulated hernia, as I have already remarked, is a much more serious affection. In strangulated hernia the intestine is fixed in a constricted position. The constriction may be due to changes at the neck of the sac, to venous engorgement, or to various other causes. A person who has long been in the habit of wearing a truss, leaves it off upon some occasion, and the hernia slips down and becomes congested and strangulated. A hernia which has long been held in position by a truss is very likely to slip down if the truss be left off. In instances where the hernia is of recent origin it may be forced down by a heavy strain.

The symptoms of strangulated hernia are: (1) a sense of pain in the umbilical region; (2) some slight local tenderness; (3) restlessness; (4) singular weakness; (5) more or less nausea and vomiting of (*a*) the last meal, (*b*) mucous and (*c*) bilious matter, (*d*)

intestinal contents; (6) obstinate constipation of bowels; (7) frequent pulse, dry tongue, delirium.

This brings us to the consideration of the treatment of strangulated hernia. The first thing to be done is, of course, to attempt reduction. Place the patient in the recumbent position, flex his body, raise the shoulders, and flex the thighs. Then give enough ether to relax all the muscles before attempting taxis. The old-fashioned plan of producing entire muscular relaxation was to place the patient in a hot bath and to administer large doses of laudanum. Of course, etherization is greatly to be preferred to this method.

What is meant by *taxis*, you will perhaps ask me? I will try to make the matter plain to you all. If it be a case of inguinal hernia, put your finger and thumb upon either side of the ring just where the sac comes out. Then with the other hand take hold of the sac and elongate it. The object in doing this is to straighten the folds out as much as possible. When you have straightened the sac well out, you may then begin to subject it to nicely graduated and uniform pressure throughout its whole mass. In this way you may, perchance, at length succeed in dislodging the contents. Be very careful in applying this pressure, and do not apply it for more than ten minutes. There is more danger in a prolonged and badly managed attempt at taxis than in an operation. Of course you may prolong your efforts at taxis over ten minutes, if the hernia be large and old. As soon as you hear a little gurgling sound, from that moment you may take courage. If it turns out to be largely an omental hernia, and you find that it cannot be reduced entire, you must endeavor to put it back by instalments.

In a case of femoral hernia, the manipulation is, of course, entirely different. Here it is very hard to reduce in some cases, as the hernia may turn completely over Poupart's ligament. If you are uncertain as to whether the hernia has turned over or not, put your finger on one of the bony insertions of the ligament, and by pushing it along you can feel the ligament throughout its whole length, provided, of course, that the hernia has not turned over it. If it is turned over, first pull it down, then place the patient on his back, raise his shoulder, turn his knee (right or left, as the hernia may be) up and in, and then begin the gradual compression of the mass between your fingers. After it has been sufficiently compressed, the hernia should be first pushed into the saphenous opening and then directed upwards.

THE OPERATION FOR STRANGULATED INGUINAL HERNIAS.

Suppose you are foiled in all your efforts at taxis. Then you must proceed at once to operate. The first step in the operation for the relief of strangulated inguinal hernia is to shave the hair carefully off that side of the pubis and scrotum. The patient must then, after being etherized, be brought to the side of the bed and his legs allowed to hang over, his feet resting on chairs placed conveniently. The hips should come just to the edge of the bed, or table. In all cases before attempting taxis, you should make a full statement of the dangers of the case to the friends of the patient, so that failing in your manipulations you may proceed at once to operate.

The incision should be made over the most prominent part of the tumor, and ought to be from two and a half to three inches long. The overlying layers should be very carefully lifted. If you cut hard you may drive your knife right into the contents of the sac. There are two ways of cutting through the skin. (1) You may take up a fold of skin between your fingers and cut through its base from within outwards, or (2), as I prefer to do, you may cut from without inwards. I begin my incision at a point over the external abdominal ring. After severing the skin, I am accustomed to make a little nick in the superficial fascia and put in my director. There may very possibly be a little bleeding from the superficial pudic when cut. Separate the sides of the wound with your fingers. Lift up with the director any of the superficial fascia that may remain after the first cutting and divide it.

This brings us to muscular fibres and connective tissue. Lift up the loops of connective tissue and cut them on your director, pushing the muscular striæ aside. These striæ will usually turn out to be fibres of the cremaster muscle. After dividing the connective tissue you reach the sac itself, which is composed of a fold of peritoneum. It is very hard to distinguish between this sac, or peritoneal covering of the hernia, and the walls of the intestines themselves. Let me point out to you some good ways of distinguishing between them. 1. Take up the presenting surface and see if you can slide the layers over one another. This, of course, cannot be done in the case of intestine. 2. When the sac contains fluid, if a light be placed on one side of it, you can discover a translucent layer above, with intestine below. 3. There are not generally any muscular fibres upon the surface of the sac, whereas, on the surface of the intestines, there may be seen regular muscular fibres running uniformly in two directions. If there are any fibres on the surface of the sac they will be found to interlace. 4. Take the finest needle in your pocket-case, and hazard an exploratory puncture. If you get fluid, it is the sac; if air, it is intestine.

How are you to act when you get down to the sac? (1) Reduce the hernia without opening the sac, or (2), if necessary, open the sac and then reduce the hernia. If you do not find it necessary to open the sac, try to find where the stricture is by running your fingers up outside of the sac. You will generally find the stricture to be situated either at the neck of the sac, or at the internal ring. It is always best to reduce the hernia without opening the sac, and for the following reasons: You wound the peritoneum by opening the sac. Wounds of the peritoneum are necessarily serious, and the inflammation may extend to the whole peritoneal cavity. The advantage claimed for the opening of the sac is that it is often impossible to discover otherwise the exact position of the intestine.

The whole question of opening or not opening turns upon the condition of the contents of the sac. In hernias of long standing the strangulation is very rarely acute in its character. If there are no very active symptoms present, the contents are presumably in a condition to be returned. Where the hernia is more recent, and the symptoms of strangulation more severe, it is dangerous to attempt reduction without opening the sac; some structural change has no doubt been going on. Where the symptoms are not very severe, it is far better to divide the stricture and restore without opening the sac. It is only in very rare instances that you will find the intestine mortified. To divide the stricture, introduce your finger until you reach the stricture, and then, using your finger as a director, divide it at once with a Cooper's hernial bistoury.

How are you to get the point of the knife under the stricture? Slip the knife flat on its side along your finger as a guide. When it slips under the stricture turn the edge up and press the knife up by means of the finger which was used to direct it to the spot. In cutting a constriction, you should always cut in a cer-

tain way. The edge of the knife should be turned directly upwards and should cut parallel to the line of the inguinal canal, *i.e.*, in the line of Poupart's ligament. As soon as you feel the stricture give way, put the knife flatwise again and remove it. After cutting the stricture, the parts should be returned by means of the fingers.

How are you to proceed when you find it necessary to incise the sac? Make a little nick in the neck of the sac, and, after introducing the director, cut the sac with a pair of scissors. After thus exposing the intestine, examine it carefully with your fingers. If it is of a chocolate color, it is a sign that it has become highly congested. After incising the sac, introduce your finger between the sac and its contents. Then run the knife flatwise along your finger as director, turn the blade up, cut the stricture, and withdraw the knife. Now that the stricture is cut, you must wait and see whether the bowel regains its normal color or not. If it does, you may restore it at once. Sometimes it does not. The congestion remains, and rubbing it between your fingers reminds you of the sensation produced by a piece of leather. Suppose there is just one small point of complete mortification; how are you to act? Tie a silk or animal ligature directly round the part, then cut off both ends of the ligature and return the bowel. Of course you could not treat a very large point of mortification in this way. How are you to act in the case of omental hernia? If the vitality of the part is gone, and it is small, put a ligature round it and return the bowel. If the mortified portion is large, after ligating it, return the sound part and keep that which has mortified at the external abdominal ring.

Suppose the loop of intestine is all sound, but greatly distended with gas, how are you to restore it? Try to press out the gas by gradual compression; then replace the bowel. When a hernia is exclusively omental, there is sometimes a good deal of difficulty experienced in restoring it. When the hernia contains both omentum and intestine, which are you to restore first? You may restore either part first, but never try to put back both at once. Find out which will go back most readily. When the intestine is so full of air that it will not go back, even after the stricture is divided, introduce your finger into the ring, dilate it, and slowly and patiently press out the air. Some surgeons are accustomed to tap the bowel in such cases with an exploring needle, but I do not advise this procedure.

All being restored, close up the wound with a few silver sutures, put a roller round the thigh, flex the limb, and administer opium in repeated small doses for four or five days, beginning with two grains during the course of the first day. On the sixth or seventh day castor oil may be given in very small doses as a gentle aperient, say a teaspoonful every six hours.

Suppose that you cannot by any means return the hernia, what are you to do then? Allow the hernial mass to remain in the wound, taking care to place over the opening of the incision a disinfecting lotion. Why do I say to leave the wound open? So that all the bloody serum and other discharges may find a free outlet, so that the sides of the bowel may become glued to the sides of the abdominal ring, and thus form an artificial anus. As the bowel mortifies, you should, of course, clip it away piecemeal.

(As regards the operation for strangulated femoral hernia, although the location of the incision is of course different, the same general directions should be followed as those which I have sketched out above in the case of strangulated inguinal hernias.)

CASE OF OVER-DISTENTION OF BLADDER UNSUSPECTED — PERMANENT ATONY RESULTING.

By ALEX. W. STEIN, M.D.,
SURGEON TO CHARITY HOSPITAL, ETC., NEW YORK.

Mr. G., æt. 48, widower; wife died five and a half months ago; wine merchant. Always been a free drinker, not, however, to intoxication. Up to the age of fifteen was subject to nocturnal incontinence of urine. Family all consumptive. Had repeated and profuse pulmonary hemorrhages in early life, and has coughed more or less ever since. Is rather feeble and emaciated. Twenty-five years ago he was advised to put a cantharides plaster over the sternum, which gave him so much relief from coughing that he has *kept the issue open ever since by applications of cantharidal ointment.* Insists that, if he allowed the issue to close, he would die. His urinary apparatus has always been in a good working condition until about ten days ago, when he noticed an unusual frequency in micturition, which became more and more marked from day to day, and now (June 20, 1874, his first visit) he is obliged to pass water, or at least make the effort, every fifteen to thirty minutes. There is much strangury, a "smarting, burning pain" along under surface of penis, midway between meatus and scrotum, which lasts about a minute. The desire to urinate comes suddenly, and is urgent, and, although he responds to the call at once, he often makes the effort without passing a drop. When he does succeed, the quantity varies from a few drops to an ounce. The strangury lasts about a minute, and subsides, *whether any water passes or not*, to recur in fifteen to thirty minutes. Has no pain elsewhere. (Believes this attack to be due to stopping the use of whiskey, to which he is accustomed, because about two months and a half ago, after stopping whiskey, he had a similar though slight attack, which entirely subsided after resuming the use of the stimulant.) Had intercourse once, about two weeks ago, and again ten days ago, since which time has noticed a slight gleety discharge. Is to take tablespoonful of the following mixture every three hours: ℞. Potass. citrat., ʒij.; ext. hyosciam., grs. xviij.; aqua camph., ʒiij. M.

June 22, 1874.—No improvement since last visit. Always obliged to stand for a moment before he succeeds in passing water, and then only after considerable effort. The stream is small; comes without force. Thinks he passes less water than usual. Urine high-colored, albuminous, and contains pus. Prepuce quite edematous, and a slight discharge appears at meatus. No additional pain along urethra during flow of urine. Size and feel of prostate, per rectum, normal.

Declines to have any exploration of urethra; attends daily to business, and will not stay at home. Continues alkalies with hyosciamus.

June 27, 1874.—(Written communication.) Getting worse. Quantity of urine voided becoming less and less, while the desire to micturate is more frequent and painful. Thinks he has not passed half-pint of urine in twenty-four hours. Directed hot hip-baths morning and evening, with following suppository at night: ℞. Ext. bellad., gr. ¼; ext. opii, gr. 1½; ol. theobrom, ʒj. M.

June 30, 1874.—Called at his house (voluntary visit). Says he feels perfectly comfortable. Has the same

frequency and smarting pain in passing water; but when the pain subsides, "there is nothing the matter with him." In evidence of his good condition, he says he has been down town all day, hard at work, and has been playing billiards all the evening. In the course of conversation, however, he stated that his abdomen "seemed swollen." This prompted an examination, and the bladder was found distended to the umbilicus. Urging upon him the necessity, he consented to the introduction of a No. 8 E. flexible catheter, and was relieved of four pints three ounces of stale urine. The flow was characteristic, slow, without force, falling perpendicularly from orifice of instrument, stopping now and then, and recurring in spasmodic spirts with each voluntary contraction of diaphragm and abdominal muscles. The evacuation of the bladder was purposely prolonged, and not completed, as was shown by the escape of urine from the catheter when pressure was made over the hypogastrium. Patient cannot say that he feels any special relief now that his bladder is empty, since *he did not feel any pain or discomfort when it was full.* All that he notices is a sense of weakness over the hypogastrium.

July 1*st*, 11 A.M.—Has had no inclination to urinate since catheterization last evening, nine o'clock. Feels very comfortable; slept all night, which he has not done in a long time. Has tried to pass water several times, but without success. Separating lips of meatus, which were agglutinated, a little thick, creamy discharge escaped. No. 8 E. flexible catheter removed *eleven* ounces of urine. After which No. 14 E. bougie à boule passed into the bladder freely and without obstruction. Patient would not remain at home, and went to his business.

As the bladder had become so thoroughly distended and insensible to the presence of urine, he was directed not to wait for a natural impulse to micturate, but depend entirely upon the catheter, which he is to employ at least four times a day.

July 3, 1874.—Has no power to empty bladder. Uses catheter but twice daily, morning and evening, although he has been made to understand the importance of using it more frequently.

May 24, 1875.—No perceptible change in the power of his bladder since last report. Has never been able to empty his bladder, and although he may now and then pass a very small quantity of urine, he is obliged to have recourse to the catheter for the evacuation of his bladder. Has continued to attend daily to business. Passes catheter morning, evening, and once during the night—each time drawing from "one-half to over a pint." In response to the question, why he allows the urine to accumulate in such quantities, says he *never feels any inconvenience whatever in holding his water when sitting or moving about; but at night, when in the recumbent posture, and after a certain quantity of water has accumulated, tenesmus occurs*, and he is obliged to have recourse to the catheter.

April 30, 1878.—Patient says his bladder seems almost insensible to the presence of urine, even when it contains considerable, and he resorts to the catheter more as a matter of necessity than inclination. When the hydrostatic pressure is great, as after drinking ale or beer, he can with some effort pass a very small quantity of water in the natural way, but he has learned to depend entirely upon the catheter, which he introduces three or four times a day. The almost appalling manner in which he thrusts the instrument into his bladder shows a perfect familiarity with its use, and an entire absence of any fear of pain. Last December an abscess formed in connection with the right epididymis, which opened, a fistula remaining (tubercular testes). Coughs and expectorates profusely. Appetite poor, but otherwise feels well enough.

In summing up the foregoing case, the following are some of the points of interest which present themselves:

1st. The question as to the length of time that elapsed from the occurrence of retention to the withdrawal of the urine is doubtful; but we may infer that retention existed, at least to a degree, on his first visit, ten days previous to passing the catheter.

2d. The remarkable immunity from pain or inconvenience, while the bladder was in a condition of over-distention, points to the fact that the accumulation must have been very gradual. The patient never suspected his real condition: and, though he realized that the quantity of urine voided was less than usual, he regarded his trouble as one of incontinence, and was firm in his conviction until the catheter demonstrated to the contrary. If hypogastrium had been examined earlier, the true nature of the case would have been revealed sooner.

3d. The quantity of urine removed, though large (four pints three ounces), was not all the bladder contained. Believing it injudicious to abstract at once all the water contained in a bladder which has been long distended, I should not have removed as much as I did, but my patient was reckless and uncontrollable, and I hoped, by magnifying the gravity of his case, to make him submit to advice and treatment. How well I succeeded, is shown by the fact that he went to his business the same day, in spite of my injunctions to the contrary.

4th. The original cause of the retention may be a question. There was no apparent hypertrophy of prostate and no obstruction to the passage of a No. 14 E. bougie or a steel sound of same size. He does not remember voluntarily holding his water, or that his bladder became at any time over-full. The first and only symptom that attracted his attention, was frequent and painful micturition. The fact that no appreciable enlargement of the prostate was discovered by rectal examination, or any difficulty experienced in the introduction of the catheter, does not preclude the possibility of the existence of such an enlargement. We occasionally see cases where considerable prostatic enlargement, as recognized by rectal examination, does not cause any material obstruction to the outflow of urine, while a comparatively small projection into the bladder and no enlargement towards rectum will constitute an effectual barrier to the complete evacuation of the bladder. But aside from prostatic enlargement, there occur other and sufficient changes in the physical condition and structure of the bladder to account for the bladder weaknesses so common in old men. The position and general physiognomy, so to speak, of the bladder is much changed in the aged; the basfond is lower, the vesical region, especially at its base, is characterized by varicose dilatation of the venous plexus there found, and by a marked accumulation of fat around the vesicular seminales, vas deferens and prostate, and fatty degeneration of its muscular walls, is not a rare occurrence. The thin, pale, and flaccid detrusor, so often associated with old age and with phthisis, or other chronic and exhausting disease in earlier life, only requires to be overstretched once to lose its expulsive power. A single neglect to empty the bladder, when called to do so, will suffice to produce permanent atony. If the muscular fibres have undergone no change other than stretching, they will of course regain their tone more

readily than when fatty changes have involved their texture. Now, as to Mr. G.'s case, it is quite possible that he may have some slight centric projection of the prostate; indeed the gradual development of the retention would point that way; but as hypertrophy is not commonly manifested by symptoms before the fifty-seventh year, his age militates against the existence of such an hypertrophy, while his feeble health and badly nourished body make it probable that his bladder is simply in a condition of atony or fatty atrophy.

I might cite instances in which the bladder has not been emptied, except by catheter, for a much longer period; but the absolute comfort and ease with which this patient has employed the catheter, and depended wholly upon it during the past four years, is another example indicating the propriety of its *early* and *continued* use in all suspected cases of prostatic hypertrophy or vesical atony.

POTASSIUM BROMIDE IN PUERPERAL CONVULSIONS.

By HENRY M. FIELD, M.D.,

PROFESSOR OF THERAPEUTICS, DARTMOUTH MEDICAL COLLEGE.

WHAT is the value of potassium bromide in puerperal convulsions? How much may we hope for from its use? Its frequently acknowledged efficacy in epilepsy would prepare us to expect something from it at least; and reports of its action in the former application, scattered through the journals of the last two or three years, certainly commend it to our attention for further investigation.

One thing I believe we should assume at the start: that the remedy must be applied with a free hand and in large doses. In epilepsy we have learned to look for nothing except from liberal medication; and in puerperal eclampsia the emergency is great, and we must act with corresponding promptness and decision. I suspect the necessity of massive doses has been too often overlooked. In a paper by Dr. Hutchison in the English *Practitioner* of last September, a case is reported in which 15 gr. of bromide was ordered every hour in convulsions of violent character; while in another equally severe, a scruple was given every two hours. "In both," we are told, "the exhibition of bromide of potassium was followed by an early diminution in the severity of the convulsions, by a longer interval between them, and by steady general improvement." Both were cases of eclampsia following on parturition.

A case of my own of the past winter, in which potassium bromide, as applied to the convulsions preceding the birth, seemed to be the chief weapon of relief and safety, I have thought of sufficient interest to report.

A lady of 26, confined with her third child. Nothing in previous history of the case of interest; nothing in its previous observation had led me to anticipate the complication with which I had to contend. Was summoned from my bed early in the morning by the husband, who reported that his wife, without any previous symptom of labor, had risen from sleep for micturition, and had passed at once into violent convulsions. Unavoidable delay caused an hour to elapse from the beginning of the seizure till I was by her side, and the convulsions still continued with unabated severity. I at once resorted to inhalation of sulph. æther, and when convulsive action had ceased and the patient could be roused sufficiently from the coma following it, gave my first dose of bromide. I had ordered one ounce in powder, and this I divided into eight equal portions, thus giving sixty grains freely diluted at once. Examination showed vertex presentation, and a relaxed state of the uterine os.

Returned in one hour to find labor progressing satisfactorily; but also symptoms of an approaching convulsion. Gave the second drachm of bromide, and remained with the patient henceforth till completion of labor, repeating the remedy at intervals. Kept her in a condition of semi-anæsthesia, according to my usual method, *i. e.*, giving chloroform on a handkerchief with each pain throughout its continuance. There being no contra-indication, administered an occasional dose of fifteen to thirty drops of fluid extract of ergot. This I did to meet three indications: to antagonize the retarding influence of the chloroform on the labor, to give impetus to the parturition while the patient was in a favorable condition for it (fearing the return of the convulsions at any minute), and, third, to act as a probable adjunct to the principal remedy.

Labor was completed in seven hours after the occurrence of the first convulsion, and without return of this complication after the first dose of bromide had been taken, although I was kept in constant apprehension of it. On leaving I took what remained of the powder with me to the druggist, where, on its being weighed, it was found my patient had received 3 vss. during the brief period of my attendance upon her.

A few remarks. There was not evidence at any time that the subject was injured by the free administration of the drug. I accomplished more than I had expected. Meeting a medical friend on leaving my patient after the first dose of bromide had been given, I arranged with him to assist me with the forceps, if at any time I should need to resort to them, and should send for him. I believe my large doses kept off convulsions, and enabled the uterus to complete the labor without further complication. Several hours after confinement there appeared suddenly another convulsive seizure of diminished severity. Return to the bromide in 3 ss. doses three or four times a day, kept the patient comfortable for forty-eight hours. Again was the remedy suspended, and again was there occasion to resort to it; and this happened several times in the fortnight following parturition, until the family learned when and how to apply the medicine without recourse to the physician. Thereafter the patient made a good recovery.

Reports of Hospitals.

CHAMBERS STREET HOSPITAL, N. Y.

DR. W. T. BULL, ATTENDING SURGEON.

(Reported by Geo. D. Clift, M.D., House Surgeon.)

INCISED WOUND OF ABDOMEN, PENETRATING—PROTRUSION OF OMENTUM, WITH HEMORRHAGE—REDUCTION AND SUTURE—PERITONITIS AND SECONDARY HEMORRHAGE FROM DEEP EPIGASTRIC ARTERY—RECOVERY.

A LABORER, æt. 42, during the night of February 4th, received several stabs from a penknife in the hands of a bedfellow, with whom he was quarrelling about the possession of a fifteen-cent bed. On admission to the hospital about an hour later, he was much prostrated from loss of blood. A wound 2¼ inches long, transverse in direction, was found 3 inches above the middle of Poupart's ligament, and a mass of omentum, as large as a man's fist, and in natural condition, protruded from it. Some of the outer fibres of the

rectus muscle were divided, and the peritoneum cut through to the extent of ¾ inch. Omentum replaced. Compress and bandage. Opium and whiskey internally. Fifteen hours later Dr. Bull examined the wound. A portion of the omentum was lying between the peritoneum and integument, and a small artery in it bled freely. Efforts to reduce it were very painful. Ether was given, the wound of the peritoneum enlarged, a catgut ligature applied to the artery, the omentum reduced, and three silver sutures inserted, the middle one including the peritoneum. The deep epigastric artery was cut accidentally, and tied with catgut. Two drainage-tubes. Spray and Lister dressing. Ordered morph. acetat. hypodermically, at sufficient intervals to relieve pain, and fluid food. On the third day there was great swelling of whole abdomen, with tenderness, nausea. Pulse, 120, and evening temperature, 101¼°. In the two previous days gr. vi. morphiæ acetatis had been given subcutaneously, and respiration had averaged 20. Edges of wound were red and puffy. Upper and lower sutures removed, and wound surface found sloughy. Wound syringed with 1 to 80 sol. of acid. carbolic. Edges allowed to gape. Compress of lot. phl. et opii. over whole abdomen. Opium increased in quantity. Patient anxious, but takes food at intervals of three hours. In the following three days 12½ grains of acetate of morphia were given hypodermically. Respiration averaged 16, evening temperature 100½°, and pulse 106. General improvement. Sloughing of a portion of integument. Wound granulating. On the seventh day sharp bleeding from deep epigastric; arrested at once by pressure, and silk ligature subsequently applied. Large natural movement of bowels. From this on there was gradual improvement. No opium after the ninth day. Diarrhœa, with watery stools, on the ninth, tenth, eleventh, and twelfth days. On the nineteenth day wound reduced to small granulating sore. Patient out of bed on the twenty-eighth day, and discharged a week later.

DISLOCATION UPWARDS OF THE ACROMIAL END OF THE CLAVICLE SATISFACTORILY TREATED BY MEANS OF A SIMPLE METHOD OF APPLICATION OF THE ELASTIC BANDAGE.

This dislocation is justly considered very intractable. Two cases recently treated in the Out-Patient Department, in accordance with the suggestions of Dr. Bull, have given such good results that a description of the apparatus may prove interesting.

R. C., æt. 26, while at work, fell from a step-ladder 2½ feet high, and struck the left shoulder against the floor. There was much pain about the shoulder, with inability to raise the arm. At the hospital next day the above form of dislocation was well marked. The end of the clavicle projected one-half inch above the acromion process, without overlapping it, and the shoulder was shortened inwards one-quarter inch. Reduction was easily effected by raising the elbow and depressing the clavicle. The arm being held in this way, a compress of two layers of paper-lint was placed over the articulation, and retained by two strips of adhesive plaster (as in Fig. 1), the edges being glued to the skin with collodion. The hand and forearm were then bandaged with a flannel roller, a loop of a bandage of elastic webbing, 5 feet long and 1½ in. wide (such as is used in Esmarch's bloodless method) passed under the elbow, the ends drawn snugly over the compress, and the anterior one carried around the axilla of the sound side (as in a spica of the shoulder), to join the other between the clavicles (Fig. 2). The ends were secured with strong pins, and the loop about the elbow was fastened to the bandage in the same way. One or two circular turns around the arm and chest (dotted line, Fig. 2), and a large sling to support the forearm and hand, completed the dressing. Collodion was painted on the skin in the axilla. The patient complained of no pain on completion of the dressing. The three following nights he was obliged to take morphine, gr. ⅛, but there was no further discomfort. The webbing stretched considerably, and had to be readjusted three times before its removal at

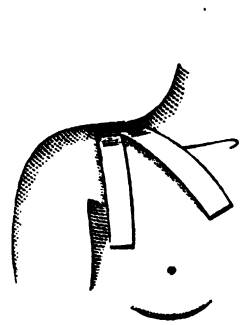

Fig. 1.

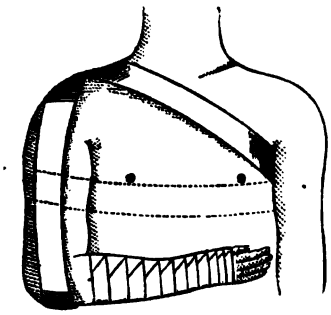

Fig. 2.

the end of three weeks. Slight excoriations were produced on either axillary fold. Collodion was painted on repeatedly, and folds of lint inserted under the bandage, and no annoyance was caused. The final result was perfectly satisfactory. There was no difference in the outline of the two shoulders, either to the eye or the touch; no stiffness of shoulder or elbow, and the lameness of the muscles from confinement disappeared in a week. The dressing was worn three weeks, and the forearm carried in a sling for a week more. One month from the injury the cure was perfect.

The second case was that of a shoemaker, 32 years old, who fell down the steps of a basement while intoxicated. The clavicle projected upwards three-quarters of an inch, but was easily reduced. Twelve hours after the injury the dressing was applied, as in the preceding. At the end of two weeks one of the "strong elastic bandages," * introduced by Dr. Martin in a paper before the Am. Med. Association in 1877, was substituted for the webbing, and proved in every way satisfactory. As the bandages were in use for ulcers of the leg, and were expensive, it was deemed undesirable to cut one. Hence, the length was sufficient to cover the surface traversed by the webbing twice over, and it was found convenient to begin its application on the posterior surface of the arm, at its middle, and to pass downwards under the elbow, thence over the shoulder, under the opposite axilla, and over the shoulder to the starting-point. A second turn was made in this way, and the ends of the bandage tied round the arm. A number of papules, with few pustules of acne, formed under the rubber in the neighborhood of the shoulder, but caused no great inconvenience. There were no excoriations. The rubber bandage, with sling, etc., was worn for two weeks, making four weeks in all that the patient was under treatment. The result was perfect. A week later the man resumed his occupation. It should be mentioned that in the latter case some pain was caused by pressure of the bandage on the ulna. This was remedied by shifting the loop forwards or backwards, so as not to bear on one spot more than two or three days in succession.

* For a description of these bandages, see the Transactions of the Am. Med. Assoc. for 1877; or The Record, March 9, 1878, page 189.

Progress of Medical Science.

Derangement of the Glycogenic Function of the Liver as a cause of Bright's Disease.— In an article bearing the above title, taken from the *American Journal of the Medical Sciences*, Dr. Gouverneur M. Smith, comes to the following conclusions:

1. Among the causes giving rise to one form of the disorder known as Bright's disease, climate is recognized as a potential one—climatic influence being chiefly operative in those sections of the earth where the vicissitudes of the weather are sharp and abrupt, as in localities of the temperate zone.

2. One of the uses of the glycogenic function of the liver is to maintain animal temperature. The function in question may be deranged in various ways. Sugar may not be formed at all or may be formed in unduly large quantities, or may be generated so sparsely as to be insufficient to subserve the wants of the economy. In a case where the sugar is suppressed, or is prepared in very moderate quantities, animal temperature is diminished, the person suffers as one exposed to harsh atmospherical conditions, and is liable to chronic congestion and organic lesions of the kidneys; and if such an individual is resident of a region in which the mean annual temperature is about 50° F., he is peculiarly prone to injuries of the renal textures.

3. Lessons in the prophylaxis of Bright's disease and the treatment of the disorder are derived from the above considerations. As means of prevention, care must be bestowed upon the nervous system, resort must be had to dietetic measures, extreme attention being paid towards promoting the healthy performance of the various functions, while the artificial temperature of the apartments and personal protection by clothing when exposed to inclement vicissitudes are important measures of defence.

Membranous Laryngitis as a result of a Definite Exposure to Cold.—The sub-committee of the Royal Medical and Chirurgical Society on the relations of diphtheria and croup, published in *The Lancet* of Jan. 26th, a request for notes of cases in which the formation of false membranes in the air-passages followed a definite exposure to cold. Dr. Johnson, of King's College Hospital, in commenting upon this, urges the necessity of careful search for the existence of any morbid influence, other than exposure to cold, which may have co-operated in any given case, illustrating the importance of this by reference to two cases, in which the appearance of the false membrane was traceable to the escape of sewer-gas. The result of his own investigations has been the conclusion that, in the absence of direct contagion, the occurrence of membranous pharyngitis or laryngitis affords conclusive evidence of infection by sewage-poison, conveyed through either air or water.—*The Lancet*, February 16, 1878.

Treatment of Tetanus.—Dr. Eben. Watson reports two cases of acute traumatic tetanus in the treatment of which nerve-stretching was performed in conjunction with the use of calabar bean, a drug in which he has not lost confidence. Death followed in both cases, yet in both the progress of the disease was apparently mitigated by the operation. Dr. Watson is not an advocate for any avoidable operation after the inception of an attack of tetanus, considering the ill-effects of the anæsthetic greater than in other patients, and its administration almost certain to excite a severe and perhaps fatal paroxysm. Unless, therefore, he were convinced that nerve-stretching exercised a beneficial influence over the disease he would neither recommend nor practise it; at present, however, he can only say that it is an operation from which we may hope for some assistance in the treatment of these very desperate cases.

Mr. Boon, of the West Indies, reports five cases of tetanus with four recoveries. Of these, the first, second and eighth were traumatic; the fourth and fifth idiopathic. The first, second and fifth were acute; third, while not very severe, had at times intense spasm; fourth was chronic. His treatment is to keep the room dark and quiet, carefully excluding draughts; to give nourishment freely, in a liquid form, at frequent intervals, and always warm; stimulants in small quantities from the first; never give purgatives; chloral hydrate together with extract canabis indica should be given in rapidly increasing doses until the frequency and severity of the spasms are controlled.

Mr. Watson Paul relates a case of idiopathic tetanus treated with atropia and chloral hydrate, in which the patient was convalescent on the sixteenth day.

The case of Dr. Samuels, of San Francisco, was one of acute traumatic tetanus, treated by chloral hydrate and potassium bromide, and the galvanic battery. During the application of the battery and for a short time afterwards the muscles were relaxed, but soon returned to their former condition. Death on the third day.

Mr. Lawson, of Halifax, reports an acute traumatic case, of a severe type, treated by chloral hydrate; no stimulants or nourishment except milk, and very little of that from August 9th to August 23d. Recovery in five weeks.

Of late years the surgical treatment of tetanus has assumed especial importance, since experiment has shown the harmlessness of manipulating or even cutting nerve trunks. For a careful study of the operation of nerve-stretching we are indebted to Dr. Eben. Watson. There are certain objections to this procedure which at first sight seem serious, apart from the want of success which has been met with. The necessity for the use of chloroform, the size of the wound, the near relations to important vessels, and the severity of the operatian in some cases, would deter many surgeons from attempting it. The process certainly deserves to merit further trial, and, at any rate, for the present, should replace amputation.—*The Lancet*, February 16, 1878.

Insane in Connecticut Poor-houses.—Dr. Abram Marvin Shew, Superintendent of the Connecticut Hospital for the Insane, reports that there are still about 400 lunatics in that State who are provided with no better accommodations than the town poor-houses are able to furnish, and advocates the erection of small asylums capable of accommodating 250 patients each, as probably the best method of making provision for pauper lunatics. Possibly a resolution of this question may be found by and by in the erection of small county hospitals, which need not be costly in structure or expensively furnished, and would not, on the average, be required to make provision for more than 25 to 30 patients. Dr. Shew finds that there is some immediate pecuniary advantage in having large hospitals, but that this advantage is more than counterbalanced by the decreased percentage of recoveries that results from lack of personal attention to each patient on the part of the medical staff.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, June 1, 1878.

THE AMERICAN MEDICAL ASSOCIATION.

On the occasion of the meeting of the American Medical Association it is usual with journalists to offer some original suggestions for improvement. In times gone by we were proud to number ourselves with the would-be reformers, and cried as loud as any for such changes in the plan of organization as would make the Association a truly representative body. Since then many important changes have been made for the better, and although there is a striking relation, as far as we are concerned, between cause and effect; we do not venture to go further than refer to the fact. However, we are scarcely glad that there are now no more flagrant abuses to attack and no more suggestions to offer for increasing the usefulness of this body. It is true, there are some propositions to be offered at the coming meeting, which may tend to simplify and systematize the work of the sections, but in a general way these will not effect the harmonious plan of government of the Association as a whole. The Association is probably to-day as near perfection, in its general working arrangement, as it can be made to be, considering the number of interests which have to be consulted and the wide range of jurisdiction which it at present enjoys. The trouble is in reality to keep it where it is. In fact, any radical change is more apt to be for the worse than the better. The profession throughout the whole country respect it for its decisions, is proud of its influence, and is in hearty sympathy with its purposes. The foundations are broadly and firmly laid, and must not be meddled with if we ever expect to build a substantial and representative superstructure. In view of this conviction we are pleased to know that no radical changes are contemplated, and that consequently the next meeting promises to be a success. The Committee of Arrangements at Buffalo have worked faithfully, and we have reason to believe successfully, to such an end, and we have the promise of papers before the sections of even more than ordinary interest. It is, of course, expected that some of the old questions which have been presented to the Association will be discussed. Many of these may be tolerated, but there are a few which can be ignored, without harming any but those who may wish to bring them up. Of course, we expect to hear of the plaster-Paris splint, of salicylic acid in rheumatism, of climate cure for consumption, of a new treatment of diphtheria, of the real origin of bacteria, of the influence of drinking water on typhoid, because these are subjects which are comparatively new and need more ventilation: but the gentleman who attempts to prove the value of Lister's antiseptic spray, should be looked upon with becoming suspicion, while the one who invents a new speculum or a new fracture apparatus should be fined with an extra volume of the Transactions.

OUR FILTHY STREETS.

Now that the Legislature has adjourned without making any provision for the proper cleaning of the streets of New York, thereby leaving the city still at the mercy of the wretchedly inefficient Street-cleaning Bureau of the Police Department, it certainly seems to be a very *à propos* suggestion which one of the morning papers makes, that Recorder Hackett should ask the Grand Jury to consider the propriety of indicting the latter, in the same manner as he has done in regard to the Aldermen and the Health-board. It is perhaps too much to expect that our streets should be as well cleaned as those of any city in the world, on account of the miserable manner in which most of them are paved; but the enormous sum of money that is annually expended for the purpose, and the facilities offered by the situation and water-supply of the city, ought to ensure their being kept in at least a tolerably decent condition. There is no reason why they should not compare favorably with those of most other cities; but their filthy state is, and has been for a long time notorious. It is true that Broadway and Fifth Avenue, with the first blocks on either side of the latter (which are swept regularly every day at private expense), strike the stranger as being rather tidy thoroughfares; but let him follow these side streets a little further to the east or west, or go into some of the other avenues, and he will have his eyes opened to the real condition of the great mass of the city in this respect. Such a vile state of the streets is unwholesome enough at all times, but during the summer it becomes a matter of infinitely greater importance to the health of the community.

It is acknowledged by all authorities that one of the chief causes of the enormous mortality from diarrhœal diseases among the children of large cities is the effect of high temperature upon refuse animal and vegetable matter, and while this is left to decay about the streets and domiciles only the most serious con-

sequences are to be apprehended. It is very well to establish a service of house to house visitation by physicians, and equip floating-hospitals, on which the children can be taken out on the water from day to day; but as long as the streets are allowed to remain in their present disgraceful condition, almost all the good which might otherwise result from these agencies is really neutralized. The cleansing of the stables of Augeas, where three thousand oxen had been confined for many years, which has furnished the text for such an infinite amount of moralizing, satire, and exhortation, ever since the remarkable feat was accomplished, was only one of the twelve labors of Alcides, and, therefore, when we consider this fact, we may perhaps be encouraged to hope that something might be done towards this not less herculean task, and before the hot weather finally sets in, if somebody in authority would only take it in hand to compel the derelict bureau to perform its duty in a moderately satisfactory manner.

THE SUPPRESSION OF APPLE-SHOOTING.

To the individual of a statistical turn of mind it must now be a question of considerable interest as to how many persons must be killed in this country before a stop will be put to the exciting sport of shooting apples off of peoples' heads with rifles and other like innocent little weapons in the variety shows, which are at present doing so much to elevate the taste and improve the morals of the community, in different parts of the land.

A recent issue of the *Louisville Courier Journal* gives an account of the latest of these "accidental" shootings, which occurred at Rockfort, Indiana. The show was being held in a tent, and a considerable crowd had naturally congregated around outside. When the act came in which "Harry Wallace" was to shoot the apple from his wife's head, two men were sent out to clear the people away in the direction towards which he was to fire; but there were so many persons present that the attempt was only partially successful. Two or three shots were fired, all of them coming through the canvas, and in the last one the bullet entered the brain of a lad outside, killing him instantly.

FEMALE RIGHTS BEFORE THE LAW.

THE *Hartford Courant* states, that the Supreme Court of Pennsylvania has lately been called upon, in an indirect way, to decide the important question as to whether a woman has any legal right to wear stays, and that it gallantly says she has. The circumstances of the case were as follows:

A lady was riding in a horse-car so crowded that she was obliged to stand up, when the car stopping in a very sudden manner, she lost her balance and fell over, thereby fracturing her patella. She sued for damages, and the railway company claimed contributory negligence on her part in that she did not take hold of the strap that is provided for standing passengers. On the other hand, she maintained that she was unable to reach or hold the strap, owing to the stays which she wore, and that with the present fashions no lady could do so, or at least not without inconvenience and possible injury. The lower court, before which the case was tried, decided that the lady, in taking hold of a fellow passenger's hand (which, it was shown, she did), had done all that was necessary and that, under the circumstances, she was not called upon to stretch up to the strap. It awarded her about $5,000 damages, and the Supreme Court of the State, having reviewed the case, declined to interfere.

It would, therefore, seem that the fair sex are protected by the law in wearing any sort of stays they please, no matter how much they may interfere with health, comfort, and freedom of action; which, indeed, are matters of secondary consideration to the ordinary female mind, as long as fashion declares in favor of any special model.

THE HEALTH BOARD AND THE NUISANCES.

WE are not surprised, in view of the great outcry against the Health Board, that the latter has been indicted by the Grand Jury. There is no denying the fact that the board granted permits to many rendering establishments in the city, that it tolerated many occupations which are, generally speaking, looked upon as nuisances, but the question which must now be decided by trial is, whether these actions were justified under the circumstances. The Hunter's Point nuisance admits of no apology, and if its long existence can be proved to be due directly or indirectly to any countenance by the board, then the latter is clearly culpable. The conviction of the proprietors of one of the most notorious establishments at that place was very proper, and more will doubtless follow. It is scarcely fair to deprive the Board of the credit of bringing about this result, at least until the contrary shall have been proved. At all events, pending an investigation, we willingly suspend judgment.

THE OUT-PATIENT DEPARTMENT OF THE NEW YORK HOSPITAL AND ABUSES OF MEDICAL CHARITY.

To such as have taken an interest in the discussion of the abuses of medical charity, connected with the Out-patient Department of the New York Hospital, it will be a matter of congratulation to learn that the obnoxious regulations, admitting all patients to the privileges of the institution, have been abolished. By such a course the governors of the hospital have shown their respect for professional opinion. Hereafter, then, "the physicians will not be expected to treat such patients as have the means to avail themselves of adequate medical advice outside," and patients from the country will be furnished with a written diagnosis of their disease only "when requested in writing by their physician."

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, April 10, 1878.

DR. JOHN C. PETERS, PRESIDENT, IN THE CHAIR.

FIBRO-CYSTIC GOITRE.

DR. BEVERLEY ROBINSON exhibited a patient, showing the results of the treatment of a large fibro-cystic goitre with injections of iron and continuous drainage, afterwards with galvanism and ergot. The history and progress of the case was read in detail.

EXPECTORATED BRONCHIAL CASTS.

Dr. Robinson also exhibited fibrinous casts which were expectorated by the child in Syracuse, the history of whose case had already been presented along with similar specimens. Since the last occasion for reporting the case, the child had continued to expectorate these casts without any special inconvenience to herself, and as often sometimes as once in 24 hours. She would not unfrequently discharge the specimens in her sleep.

DR. CARPENTER stated that he had seen similar casts discharged from the same patient, some of them more perfect than the one presented. With the exception of the phenomena attending the discharge and the presumably abnormal condition of the bronchial mucous membrane, the child was in good health.

DR. PETERS referred to the monograph, upon the subject of bronchial casts, by Dr. Stephen Rogers, which was read some years ago before the Medical Society of the County of New York, in which the history of a very remarkable case was given.

DR. VAN GIESEN asked if, in Dr. Robinson's case, the larynx had been at any time invaded. The answer was in the negative.

DR. PETERS referred to a lady under his observance, who expectorated a large number of such casts every few weeks.

DR. E. C. SEGUIN suggested that some good effect might be obtained by the administration of arsenic, based upon the influence of that drug upon certain forms of colitis.

DR. VAN GEISEN asked if there was any fever during the formative stage of this deposit. There was, however, no evidence of such a condition from the history, so far as it had been ascertained.

BRAINLESS FŒTUS.

DR. E. C. SEGUIN presented the head of a brainless child. The fœtus from which it was removed was brought to him a week before, by Dr. Mason. The mother had no symptoms during pregnancy which would lead to the anticipation of any extraordinary result, and the child was known to be alive up to a few hours before birth. It was born dead, the breech presenting. The uterus contained a large amount of amniotic fluid. Every part of the body was perfect except the head. The latter was examined with care. There was rather a perfect face, large eyes, perfectly formed pupils, and large ears. On the top of the head, which sloped horizontally backward from the brows, was a bright, vascular membrane overlying a sac which, in its turn, overlay a thin lamella of bone. There was no trace whatever of the cerebral vesicle, its place being occupied by the sac filled with serum. The cranial nerves were well developed.

DR. PUTNAM-JACOBI referred to a similar case, in which a fœtus lived 29 hours.

UNUSUAL DEFORMITY OCCURRING IN A CASE OF VERY ADVANCED FUNGUS ARTHRITIS OF THE KNEE-JOINT—AMPUTATION OF THIGH—RECOVERY.

DR. BRIDDON presented a specimen of the above, with the following history: On the 20th of March of the present year, I was consulted by Dr. Matthias Abel of Quakertown, Hunterdon Co., N. J., concerning a farmer in his neighborhood who had been suffering for many years with disease of the knee-joint, and who was anxious to be relieved of his infirmity.

The Doctor furnished me with the following history: The patient came under his observation in April, 1873. He was at that time thirty years old, and had been suffering for two months with trouble in the joint, which was recognized as strumous, and he was advised an appropriate treatment, which he declined to submit to. He then fell into the hands of a "natural bone-setter" residing in Newark, under whose care he unfortunately remained for a period of two years, the treatment consisting in local frictions and active movements of the joint. He then returned to Dr. Abel, who found him emaciated, suffering from hectic and anasarcous swelling of both extremities, with fistulous openings communicating with the joint. Under tonic and suitable dietetics his general condition improved, the local condition remaining stationary.

I visited the patient on the 27th of March. I found him excessively emaciated, his face, upper extremities and trunk offering a marked contrast to his swollen lower limbs. His face bore the lines of long and continued suffering, was pale and bloodless; the hue was not the white, waxy one that belongs to nephria, but decidedly that which characterizes anæmia from suppuration. Both legs were infiltrated with solid œdema that scarcely pitted on pressure; the left was the larger of the two; the swelling extended nearly to the groin, and involved the scrotum; the skin of the diseased limb was eczematous, the leg was flexed to more than a right angle, and the flexion was unusual. It was displaced laterally, so that when the thigh was in the normal position the sole of the foot faced the inner aspect of the opposite thigh; integuments of the knee were red and brawny, and there were three large openings through which the finger could readily be passed, and through which the carious articular surfaces could be seen and felt.

There were no visceral complications. At my request, examinations of the urine had been made, and nothing found to indicate renal trouble. His digestion was good, his pulse below one hundred, his eyes bright, and determination firm; in fact, he knew no fear, and was cheerful at the prospect of getting rid of a useless member. Nothwithstanding his otherwise unpromising appearance, and taking into account the fact that the constitution which had resisted such ravages must be worth something in estimating the chances of an operation, I determined to submit him to amputation.

Ably assisted by Drs. Able and Cooper, and a couple of farm-hands, I removed the limb through the junction of the middle and lower thirds. Esmarch's bandage was used, and I do not think he lost an ounce of blood.

On the fifth day after the operation the doctor informs me that his patient is doing remarkably well.

Examination of the part removed revealed the following facts: In the irregular cavity between the heads of the bones were impacted several fragments

of cancellous bone; there was not a vestige of synovial membrane or articular cartilage.

The superior surface of the head of the tibia was displaced so that it looked directly outward; the inner half of this surface was destroyed to the depth of three-quarters of an inch, with deeper large cavities containing necrosed masses of cancellous tissue; the outer half represented these changes to a less extent, but was riddled with perforations leading to cavities containing detached portions of dead bone.

The surface of the inner tuberosity with the contiguous surface of the internal border formed a large articular facet made plane by osseous deposit and covered with a layer of smooth granulation tissue, which articulated with a similar surface on the posterior aspect of the internal condyle of the femur.

Both condyles of the femur much deformed; posterior surface of inner condyle lying in contact with inner tuberosity of tibia; large cavity passing upward from the intercondyloid notch-cavity in each condyle opening behind and containing sequestra. Spur of bone two inches long and half an inch wide, attached by one extremity to the tubercle on the external condyle, and by the other to the posterior aspect of the head of the fibula, probably developed in the external lateral ligament; there are also large stalactiform outgrowths from posterior surface of head of tibia, and from internal condyle of femur.

EPITHELIOMA OF TONGUE, PARTIAL EXTIRPATION—LIGATURE OF LINGUAL ARTERIES.

Dr. Lewis A. Stimson presented an epithelioma of the tongue, removed from a man 40 years old, who gave the following history: He contracted syphilis in 1854, the latest manifestations of which occurred in 1862 in the form of ulcers on the legs and forearms. In August, 1877, he began to suffer in the right cheek and ear from pain which he compared to a toothache; in the following November he noticed a lump well back on the right side of the tongue, and, early in December, the pain in the ear being then very severe, he entered Bellevue Hospital, where he was treated with poultices and leeches on the face, and the lump, which he was told had ulcerated, was cauterized. After remaining a fortnight at Bellevue he was transferred to Charity Hospital, where the treatment, he says, consisted of large doses of the iodide of potassium, and very painful local applications to the ulcer. His condition grew steadily worse, and on the 13th of February he left Charity, and applied soon after to Dr. Satterthwaite, who made the diagnosis of epithelioma, and sent him to me.

I found him a pale, flabby, cachectic man, with smooth, depressed, circular scars on the legs and arms, a very fetid breath, and constant dribbling from the mouth. The right side of the tongue, beginning an inch from the tip, was much swollen, its surface rising freely half an inch above the left half, and the raphe crowded far over to the left side. In the centre of this swelling was a large excavated ulcer occupying the side of the tongue and half the breadth of the dorsal surface. Its edge was irregular, everted, and granular in places, and undermined in others, its color pink, the adjoining tissue hard to the touch, but normal in color. The ulcer was about half an inch deep, and its base covered with a soft, gray putrilage. A row of small superficial ulcers extended along the border of the tongue to its tip; they were clean, with hard, raised pink edges. The tongue could not be protruded, nor could the finger be passed under its tip, but the floor of the mouth could be felt below the large ulcer, and it was not involved. The large ulcer bled slightly when touched. No gland could be felt on the left side, but on the right side the normal depression below the angle of the jaw was obliterated and a large gland could be felt under the edge of the sterno-mastoid.

The patient spoke very indistinctly, complained of constant pain in the right ear, pain in the pharynx on swallowing, and pain on pressure over the right side of the hyoid bone.

Although the history and appearance of portions of the ulcer indicated an epitheliomatous character, it was thought best, in view of the previous syphilis, the undermined edge, and the multiplicity of the lesions, to again give the iodide of potassium and push the dose rapidly to the point of tolerance. Beginning with forty-five grains daily, it was raised to one hundred and twenty grains in about a week, and at the end of this period the swelling of the tongue had diminished, the ulcer at the tip seemed on the point of healing, the pain was less, the patient looked much better, and a few pustules of acne appeared on his forehead. Meanwhile I had cut off one of the points on the edge of the ulcer and examined it microscopically without finding any evidence of epithelioma. A few days later the dorsum of the tongue became swollen and hard just in front of the ulcer, the mucous membrane thinned gradually, and a small, round, pink ulceration appeared a quarter of an inch from the edge of the ulcer and united with it the next day by the breaking down of the intervening strip of tissue. I cut off the angle formed by the union of the two ulcers, examined it microscopically, and again failed to find evidence of epithelioma. The daily dose of the iodide was raised to one hundred and fifty grains, and fumigations of a drachm of calomel given every morning. Again he improved; the swelling diminished, the main ulcer was filling up, and its base became pink. But still, after nearly a month's treatment, it could not be said that the condition had improved, and it was evident that the pink granulations, which had nearly filled up the original excavation, were too hard and were continuous with the lump in front. So I anæsthetized him and cut off a part of the hard, granulating edge at the point where I had removed a piece once before. This time, however, the tissue was very different: its edge was not undermined, it was very friable, bled but little, and the microscope showed it to be epitheliomatous. At the same time I was able to get my finger under the tip of the tongue and thus to learn that its under surface was occupied by a hard, lobular mass connecting the main ulcer with that at the tip.

The next day I tied both lingual arteries in the digastric triangle and removed the right half of the tongue with scissors through the mouth.

The points of especial interest in the case seem to me to be: 1st. That portions of the edge of the ulcer were not epitheliomatous either in appearance or histologically; and this may be explained by supposing the deeper spread of the tumor to have cut off the vascular supply of portions of the surface not yet involved by it. In due course these portions ulcerated, and the ulceration not involving epitheliomatous tissue, did not have an epitheliomatous character; or it may have been the result of the cauterization.

2. The multiplicity of the lesions. Epithelioma of the tongue, as Ricord has expressed it, is *unique*; and this is so true that Fournier in his latest work on the subject can mention only two exceptions. In this case the duality of the lesion was probably more apparent than real, for the link of epitheliomatous tissue which was at last found on the under-surface

connecting the two ulcers probably existed at the beginning.

3. The improvement under the iodide. This I consider due solely to the stoppage of the previous irritating local treatment.

4. The change in the base of the ulcer. At first the ulcer was deeply excavated with a foul, irregular base, but afterwards the base became pink and granular, and rapidly filled up the cavity. In appearance the ulcer was healing, but in fact it was filling with epithelioma.

5. The pain in the ear, which has been so prominent a symptom from the first. Anger and Fournier say this symptom never accompanies syphilitic disease of the tongue, but is quite common in epithelioma.

NEW YORK ACADEMY OF MEDICINE.

Stated Meeting May 2, 1878.

DR. S. S. PURPLE, PRESIDENT, IN THE CHAIR.

ARE MEDICINES, PARTICULARLY NARCOTICS, DELETERIOUS TO THE FŒTUS WHEN ADMINISTERED TO THE MOTHER DURING GESTATION AND PARTURITION?

DR. SALVATORE CARO, in answering the above question, read a very elaborate paper, in which he considered the anatomical relations between the maternal and the fœtal circulation, the method by which oxygenation of the blood in the fœtus was performed, and the reasons why such drugs as salines and ethereal substances affected the fœtus, while the fœtus remained unaffected by woorara, opium, etc., when administered to the mother. He then reviewed the indications for the use of opium during gestation and parturition and its method of action upon the mother.

With reference to the maternal and the fœtal circulation, Dr. Caro reached the conclusion that there was no direct communication between the blood-vessels of the mother and those of the fœtus, and that the blood of the one was always separated from the blood of the other. The proper oxygenation of the blood was obtained by the diffusion of gases through the delicate membranous septum which prevented the mingling of the blood of the fœtus with that of the mother.

Dr. Caro then made an elaborate study of the weight of the fœtus at different periods in gestation, the average quantity of blood possessed by the mother, and the quantity of morphine solution that would be present in the blood of the fœtus, admitting that its substantial alimentation came from the blood of the mother, and reached the conclusion there would be so trifling a quantity present that it would be incapable of producing any deleterious effect.

With reference to the use of opium in parturition, the chief indication was to relieve annoying pain and overcome rigidity of the os uteri. Its primary action was upon the nervous system of the mother; its direct action was expended there, and Dr. Caro was unable to understand how the nervous system of the mother could influence the nervous system of the fœtus. Special reference was made to cases reported by Drs. Gillette, Matthewson, Thomas, Mundé, Barker, of Morristown, N. J., and others. The doctor was unable to understand, if the drug administered to the mother during parturition produced deleterious effects upon the child, how it was that in one man's hands it had always been used with impunity, while in the hands of others it had always been followed by injurious effects upon the child.

An abstract of Dr. Caro's first paper upon this question, read before the Obstetric Section of the Academy, can be found in THE MEDICAL RECORD for 1877, p. 766.

Dr. Caro's paper being before the Academy for discussion, DR. J. C. DALTON remarked that the practical bearings of the paper were very evident, and in it also there had been raised interesting physiological questions.

Did a drug, especially morphine, administered to the mother during pregnancy, also affect the fœtus? With regard to the *modus operandi* of this communication, if it did exist, full mention had already been made by the author of the paper; and although there was a delicate, transparent membrane between the blood of the mother and the blood of the child, at the same time there was a wide door open for the drug to enter the fœtal circulation. The direct passage of blood from mother to fœtus was not necessary in order to permit the transmission of material from the mother to the child. When it was recollected that everything which the fœtus had, with the exception of the minute egg from which he started, was material that came from the maternal blood, it must be acknowledged that there was no *a priori* impossibility with regard to the passage of the drug from the mother to the child; certainly we were not able to say that it was impossible for morphine, administered to the mother, to enter the fœtal circulation. At the same time, it was well to bear in mind that we could not say that it did pass from one circulation to the other. Although morphine was absorbed into the circulation and carried into the brain and absorbed into the substance of the brain, it was not certain that it passed out from the maternal vessels into those of the fœtus. For it had been proven that some substances passed into and out of certain sets of blood-vessels, and yet did not pass into and out of others. For example, potassium iodide passed out of the system by the saliva, while potassium ferrocyanide never passed out through the salivary vessels, yet both substances passed out through the kidneys.

Another question suggested itself: Was it necessary for the morphine to pass bodily from the maternal blood to the fœtal blood in order to produce an effect upon the fœtus? Might not an effect be produced upon the fœtus in consequence of an effect produced upon the nervous system of the mother without the morphine having any direct part in the operation?

Dr. Dalton believed that we had arrived at a point where we could not deny the possibility of such an effect. There were well-authenticated cases in which simple nervous impressions produced upon the mother had produced an effect upon the fœtus. How that effect was produced had not been explained, but there was an almost universal adhesion to the opinion that purely nervous disturbances of the pregnant woman might produce an impression in the body of the fœtus. Whether it was done by continuity of nerve-filament from the mother to the fœtus, or whether it was all accomplished by the influence of the vaso-motor nerves, Dr. Dalton was unable to say. It was well known that a nervous impression upon the mother increased the heart's action, and certainly we could not be surprised that it might produce a variation in the circulation of the maternal portion of the placenta, and if that disturbance was well marked and continuous it must have an effect upon the nutrition of the fœtus. It was also well established that the modification of the nutrition of the fœtus produced by a nervous impression made upon the mother might be very local in character. Recollecting those cases, it might be well to bear in mind the question, might not a drug administered to the mother during preg-

nancy produce an effect upon the fœtus indirectly, and not alone by the transportation of the drug into the fœtal circulation? Dr. Dalton did not think we were in a condition to say that opium administered to the pregnant woman in poisonous doses, or as taken by the opium-eater, was injurious to the fœtus. In ordinary practice morphine was given for certain reasons. Now, suppose that the pregnant woman was suffering from some condition which demanded morphine, it was doubtless advisable to give the morphine and avoid something worse, rather than withhold it through fear of injuring the fœtus and expose both mother and child to more serious consequences.

Dr. Isaac E. Taylor remarked that in studying the cases reported by Dr. Gillette, he had been impressed with the fact that a very small quantity of opium was used, that the effect upon the nervous system of the mother was very rapid, and that the appearance of the child was strikingly like what he had seen in children who were sacrificed by well-known causes, and not by the use of opium.

With reference to the anatomical structure of the placenta, he had supposed there was no reason, if there was absorption, why the drugs might not pass through the delicate separating membrane and enter the circulation of the child. But there was no authority save one, who had shown that the urine contained morphine.

Dr. Taylor was not prepared to reject the cases reported by Dr. Gillette, in which it was thought morphine exercised deleterious effects upon the child, but we did know of effects produced upon the fœtus by nervous shock communicated to the mother, as had been suggested by Dr. Dalton.

Dr. Taylor then related a case in which a sudden impression made upon the nervous system of the mother was followed by the death of the child, and yet the placental murmur continued for some time afterwards.

Dr. Taylor further referred to a case in which the child presented in the posterior occipital position, was still-born, and presented the same appearance as in the cases reported, in which the life of the child was thought to have been sacrificed by the administration of opium to the mother. Dr. Taylor was unable to determine how true narcosis could be produced in so short a time as had been reported in some of the cases. In settling this question, the effect produced upon the child by tedious labor and by position should be taken into careful consideration.

Dr. Corson remarked that although it should be remembered the young child was exceedingly sensitive to very minute doses of opium, it was quite probable there was not the same liability to poison a fœtus. The immense value of opium in obstetric practice would prevent us from materially modifying our practice, even in the face of the facts presented by those who believed there was danger of producing deleterious effects upon the child. In his own practice he had never hesitated in urgent cases to use opiates freely to lessen the agonies of protracted labor, and he had not noticed any perceptible subsequent ill effects in the children thus born.

Dr. Mundé granted, as claimed by Dr. Caro, that opium administered to the mother *by the mouth* was absorbed and entered her circulation without affecting the fœtus. But Dr. Caro had overlooked one point, and that was, the effect produced upon the fœtus by the hypodermic use of morphine upon the mother. In all the cases which Dr. Caro had reported the morphine had been administered by the mouth, and it was claimed by those who argued upon the opposite side of the question, that the *rapid absorption* of the drug, such as took place after its use hypodermically, no matter in what manner it might act, whether through the circulation of the fœtus or the nervous system of the mother, affected the fœtus more rapidly, consequently more deleteriously. The practical question, therefore, was, could we continue the hypodermic use of morphine, as had been done, without exposing the fœtus to the injurious influence of the drug? Dr. Mundé was of the opinion that we could, but his belief did not change the importance of the question, and he thought it was one upon which Dr. Caro had not been sufficiently explicit.

Dr. Sell referred to gelsemium as a substitute for opium in the treatment of rigid os uteri. He recommended it in the form of concentrated tincture, and in doses of from five to eight drops.

Dr. Caro, in closing the discussion, stated that the questions raised by Drs. Dalton, Taylor and Mundé had been considered and already embodied in his paper, but that the length of the paper had prevented him from directing especial attention to them. With reference to the use of morphine hypodermically and by the mouth, he always employed the latter method, when possible, because he believed that the effect produced by the drug could be better regulated than when used hypodermically.

The evidence which he had obtained from his professional brethren regarding the influence of morphine upon the fœtus, when administered to the mother during parturition, had come from all parts of the country. All the reports had been with reference to its *hypodermic use*, and no deleterious effect had been realized.

The Academy then adjourned.

New Instruments.

A NEW INSTRUMENT

AND

A NEW METHOD OF TREATING HEMORRHOIDS.

By J. Q. ADAMS, M.D.,

CARMEL, N. Y.

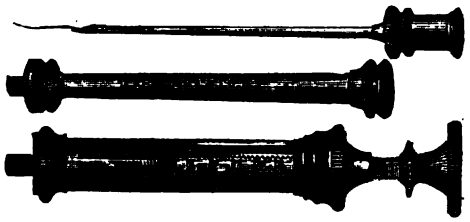
Quite recently I noticed a description of a new method of treating hemorrhoids, which was a reprint of an article by Prof. Edward Andrews, orignally published in the *Chicago Medical Journal and Examiner*. It was by injecting carbolic acid and olive oil or glycerine into the hemorrhoidal tumor by means of the hypodermic syringe. It was claimed that the acid would coagulate the blood, set up inflammation, and occlude the vessel.

The strength recommended was three parts of carbolic acid to one of olive oil or glycerine. It struck me as being a very ready means of getting rid of those exceedingly troublesome tumors, and I at once put the treatment to the test with very gratifying results.

I found two objections, however, to the hypodermic syringe for that purpose.

First, it was too short to reach internal hemorrhoids through the speculum, and, secondly, the calibre of the needle was too small to admit of the easy flow of the carbolic mixture. To obviate these difficulties I applied to Messrs. J. Reynders & Co., to make me a

syringe as shown in the accompanying woodcut, and which I have named the *Hemorrhoidal Syringe.*



The capacity of this syringe is ten minims. The cylinder is one and a half inch in length; cylinder and piston, when closed, two inches; a small canula attached to the cylinder two inches, and to this a needle two inches long, making the whole length of the instrument six inches. The calibre of the needle is about twice that of the hypodermic syringe. With this I can readily reach any internal hemorrhoid likely to occur, since these tumors are formed almost always by the dilution of loops of veins rather than in the straight longitudinal veins, and hence are seldom situated more than one or two inches from the anus. The injection of carbolic acid is appropriate wherever the ligature is appropriate; for obliterating the dilated vessel before stasis occurs; before a clot is formed. After complete stasis and formation of a firm clot, the lancet is the most ready means of relief. I believe in most instances the injections are equally as effective as the ligature, and possess advantages over it. First, by causing very much less pain, and, secondly, by being much more easily applied, especially above the sphincter. Then there are ten who will submit to the injection to one who will submit to ligation; at least I think it is so in my practice. Then again the bowels need not be shut up as after ligation. The patient can go about attending to light work; morning after the operation take a saline laxative and have a passage from the bowels without the slightest pain or hemorrhage, provided you have selected the right tumor for operation.

In regard to the quantity of the mixture (carbolic acid, ʒiii., olive oil, ʒi.) to be injected into a tumor, it should never exceed five minims at one time. By the use of eight minims I have in two instances seen suppuration follow.

I now use from two to five minims, according to the size of tumor; never inject a tumor a second time until the inflammation has completely subsided, say ten days or two weeks, then, if shrinkage has not taken place, inject a second time. But during this period of waiting we are not to be idle. We must ply our patients with the daily use of *saline cathartics.* When we encounter a case of hemorrhoids we usually find constipation accompanying it, and we are very apt to regard the constipation as the cause of the hemorrhoids. It may be a remote cause, but I believe it is very seldom the primary cause. It is more correct, I think, to regard the hemorrhoids and the constipation as the results of a common cause, viz.: *sluggish portal circulation.* Hence the manifest relief so often obtained in this malady by this class of cathartics.

Too much importance cannot be attached to the use of dilute saline cathartics in the treatment of hemorrhoids. The Congress water is my favorite; a pint or a quart every morning before breakfast, as the case may require. In case the patient cannot afford the Congress water I give some of the artificial mineral waters, or the sulphate of magnesia instead. Some one of these should be continued two or three months.

HOLLOW CONICAL SOUND.

By J. L. HICKS, M.D.,

FLUSHING, NEW YORK.

Nearly two years and a half ago I requested Messrs. F. G. Otto & Sons to make for me a set of four hollow conical sounds of steel, with an internal calibre of about one-sixteenth of an inch, to be used with a long whalebone guide. The base of the cone is at

the junction of the curve with the shaft. The size of the smallest sound is No. 7 (French scale) at the point, and No. 10 at the shaft; the largest, No. 10 at the point and No. 18 at the shaft; the others intermediate. The curve is Van Buren's.

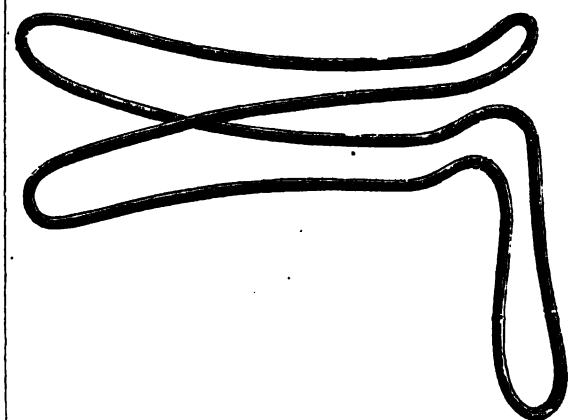
I have demonstrated practically the utility of these sounds in a considerable number of cases of stricture, and have realized their advantages, both for prompt relief of retention and for dilatation, and I believe them to be as safe as any metallic sounds can be. The guide, running through the entire length of the shaft of the instrument, is not likely to become jammed or broken, and the point can hardly go astray and do damage even in unskilful hands. When the bladder has been reached and the guide withdrawn, the instrument serves as a catheter.

A RECTAL SPECULUM, AND A FEMALE URETHRAL SPECULUM.

By GEO. F. FRENCH, M.D.,

PORTLAND, ME.

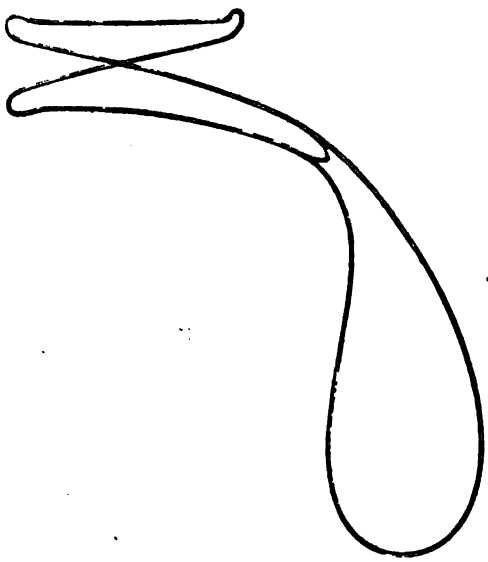
At a recent meeting of the Cumberland Co. Med. Society, at Portland, Me., Dr. Geo. F. French exhibited a modification of Dowell's vaginal speculum adapted to use in the rectum.



The instrument is made of steel wire, of sufficient flexibility to allow the sides to approximate at their ends, when introduced, and with rigidity enough to retain its shape. There is a slight constriction near the handle, for the sphincter ani to grasp, and a lateral flaring of the blades which effectually prevents the instrument from slipping out of the rectum, even after the sphincter has been ruptured. This speculum is equally well adapted for use in the vagina and has

the advantage over other vaginal wire-specula of being *self-retaining*. The handle can be so deflected as to bring the upper, lower, or either side of the rectum into view for mere inspection or operative procedure. The smallest size is an efficient endoscope; can be introduced without discomfort to the patient, and is suitable for ordinary office use; the largest size requires anæsthesia, involves rupture or extreme dilatation of the sphincter, and has been found particularly serviceable in quilting a hemorrhoidal surface too rotten to be dragged outside and ligated.

Dr. French has also devised another speculum, on the same principle, for exploring the *female urethra*,



and by simply straightening the handle, it becomes equally serviceable as an endoscope for the dilated *Cervix Uteri;* in both cases its utility will be enhanced by the aid of a concave mirror,

A PRACTICAL PNEUMATOMETER.

To the Editor of The Medical Record.

Dear Sir:—Since publishing, about a year since, in the *American Journal of Medical Sciences*, a list of one hundred cases observed with a new form of pneumatometer, so many inquiries have been received from physicians regarding it, that I trust you will grant to them and to myself the space necessary for a brief description of the instrument.

Properly it is a pneumasyren. It is of moderate cost, and portable, with the advantage that it may be prescribed for patients in whom the vital chest capacity is deficient.

The engraving shows the simplicity of the device, but not its mechanism. Briefly, it consists of a glass tube, one inch in diameter and ten inches in length, with metallic end-pieces, a piston made of two disks perforated by two rows of fine sloping holes precisely like the syren of Dove, a spiral spring, and finally an index and register. Expiratory and inspiratory efficiency, both actual and relative, are recorded, and the waviness and inequality of either are made evident to the ear.

Better and of greater advantage, however, than this is the fact that the instrument will, by constant or rather frequent use, develop chest capacity, re-dilate the cells collapsed and weakened by incipient disease, and by its allowing a free passage of air will do this without danger to the affected tissues—differing in this last particular from the ordinary pneumatometer, which, however perfect as an instrument for scientific observation, could hardly with safety be universally prescribed.

Forced *expiration* produces a low musical note gradually growing more and more high and intense, but sensitive to the least changes in the power exerted, while the index is steadily pressed toward the further end, and remains in place after the effort is exhausted. The latter has now to be pushed back with a wire replacer designed for the purpose, and by reversing the instrument full and forcible *inspiration* may be employed with similar results. The tube being graduated, the relation as well as the power of the inspiratory and expiratory efforts may be at once ascertained.

The instrument has been manufactured by Messrs. Shepard & Dudley, of 150 William Street, New York, at a figure scarcely above its cost, and but one-half that paid for those I have had elsewhere made for my own use.

Edgar Holden, M.D., Ph.D.

Newark, N. J.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from May 19 to May 25, 1878.

The following named officers will represent the Medical Department of the Army at the annual meeting of the American Medical Association in Buffalo, N. Y., on June 4th next:—Surgeons J. R. Smith, B. E. Fryer, J. J. Woodward, and J. S. Billings.

Middleton, J. V. D., Major and Surgeon. Relieved from duty at Fort Schuyler, N. Y. H. and assigned to duty at Fort Wadsworth, N. Y. H. S. O. 86, Dept. of the East, May 17, 1878.

Tremaine, W. S., Capt. and Asst. Surgeon. Granted leave of absence for one month and permission to apply for one month's extension. S. O. 92, Dept. of the Missouri, May 21, 1878.

Caldwell, D. G.. Capt. and Asst. Surgeon. Granted leave of absence for two months. S. O. 108. A. G. O., May 18, 1878.

A Novel Milk Adulteration.—To the *Analyst* for April Dr. J. Muter communicates the result of examination by him of a sample of milk to which his special attention has been directed, in consequence of the very low percentage of ash which his preliminary analysis showed. After numerous researches, he at last found that the foreign matter in the milk was glycerine, which is certainly a most ingenious addition, as a solution of that body in water of 12 per cent. strength has a specific gravity of 1:030; and he found, after several experiments, that 35 per cent. of such glycerine water might be added to milk without being detectable either by gravity or by the ordinary "solids not fat" process. Moreover, such an amount does not give any extraordinary sweetness easily detectable by the taste.

ASSOCIATION OF MEDICAL OFFICERS OF AMERICAN INSTITUTIONS FOR IDIOTIC AND FEEBLE MINDED PERSONS.—The third annual session of this Association will be held at the Asylum for Idiots (Dr. H. B. Wilbur's), Syracuse, on Saturday, June 8th, at 9 A.M. The following papers will be presented and discussed:

1. "The relation of Speech or Language to Idiocy," Dr. H. B. Wilbur, Syracuse. 2. "The laws of Heredity as defined in the conditions of Idiocy and Imbecility," Dr. G. A. Doren, Columbus, Ohio. 3. "The Brain; relation of Function to Organization or Development," Dr. D. A. Morse, Columbus. 4. "The recent progress in the treatment of Idiots," Dr. E. Seguin, New York. 5. "Education of the Imbecile," Dr. O. W. Archibald, Iowa.

The appointment for Saturday, June 8th, is made, so that members who desire may attend the American Medical Association at Buffalo, and return from thence, after the adjournment, to Syracuse, on Friday, June 7th. The meeting of our Association will hold over the following Monday.

RATIONAL TREATMENT OF STRICTURE OF THE URETHRA.—Dr. S. W. Gross, of Philadelphia, read a paper with the above title at a meeting of the Medical Journal Association of this city, on the evening of May 24th. A large audience was present. Remarks were made by Drs. Gouley, Otis, Keyes, Weir, and Stein. The paper will be published in full in a future number of the RECORD, together with the discussion thereon.

RAPID LITHOTRITY, WITH EVACUATION.—The crowded state of our columns prevents us from publishing some interesting remarks by Dr. Henry J. Bigelow, of Boston, upon the New Method of Lithotrity. It will appear in our next issue.

AMERICAN NEUROLOGICAL ASSOCIATION.—The Fourth Annual Session of the American Neurological Association will be held in this city on Wednesday, June 5th, at 2 o'clock, P.M., in the lower lecture-room of the College of Physicians and Surgeons. The profession are invited to be present.

MASSACHUSETTS MEDICAL SOCIETY.—The Ninety-seventh Annual Meeting of this Society will be held at the Lowell Institute Hall, Boston, commencing on Tuesday, June 11th.

VERMONT STATE MEDICAL SOCIETY will hold its Semi-annual Meeting at the Brooks' House, Brattleboro, Vt., June 12th and 13th.

CHEAP MEDICAL LITERATURE.—"An Eclectic Medical Library for $3.50. The cream of the literature of this school for the past five years." *Vide* advertising column of one of our exchanges.

UNIVERSITY OF VERMONT.—The medical department of this Institution has the largest number of students that have ever assembled within its walls. The increasing prosperity of the college is chiefly due to the Faculty having raised the standard of qualifications for graduation, and to the establishment of the "Mary Fletcher Hospital," which will soon be completed and afford excellent facilities for clinical instruction.

POSITION OF PARTURIENT WOMEN IN ROUMANIA.—According to M. Obédénare, the Roumanian women, when in labor, place themselves on all fours, resting on the knees and forearms. The midwife presses the patient around the waist and compresses the abdomen forcibly with her arms, in order to prevent the uterus and its contents from rising in the intervals of the contractions. The after-birth is buried, sometimes with the mother and child.

ABSORPTION OF TINCTURE OF IODINE BY THE SKIN.—Dr. L. Menager has experimented upon children with a solution of equal parts of tincture of iodine and glycerine, rubbed into the skin, and has arrived at the following conclusions. 1. Iodine in tincture, mixed with glycerine and applied to the external integument, is absorbed. 2. This absorbed iodine is invariably found in the secretions and in the urine. (Dr. M. tests for iodine by adding a little starch to the urine in a test-tube and then dropping a few drops of nitroso nitric acid into it. This gives a blue or violet color, according to the quantity of starch present.) 3. This application may give rise to certain symptoms, usually a variety of mild temporary albuminuria. 4. Dressings containing tincture of iodine may be employed as a means of introducing this medicine into the system when it cannot be taken by the stomach. 5. It must not be forgotten that when this absorption takes place in patients subject to nervoso-vascular erethism, as in certain cases of phthisis, where these dressings are often practised, they may do more harm than good.—*Dublin Med. Press and Circ.*

DANGERS FROM SALICYLIC ACID.—Several instances have occurred in which this agent produced disagreeable consequences. Dr. Watelet communicates a paper to a late number of the *Bull. de Therap.* on this subject, entitled "Accidents following the Administration of Salicylic Acid." The details are given of two cases of rheumatism treated by salicylate of soda, one of which was followed by gangrene of the lower extremities, and both by cystitis, obstinate constipation, and coldness of the extremities.—*Dublin Press and Circ.*

TYPHOID IN MILK.—Another epidemic of typhoid fever has been traced in a manner which does not admit much room for doubt to contaminated milk, thus again proving how the most essential and wholesome article of diet may become the medium for the diffusion of deadly disease. According to a special report of the medical officer for the Moss Side Local Board, Manchester, no less than twenty-seven persons have recently been attacked with typhoid fever. There were besides five cases in the neighboring districts of Withington and Stretford. All these cases occurred in the first three months of the current year, while during the whole of 1877 but one death from typhoid was registered. Out of the thirty-two cases twenty-nine of the patients received their milk from the same

dairy. With two exceptions the ash-pits and drains in connection with the infected houses were in good order, and among 214 neighboring households receiving milk from another dairy there was but one household affected, and this exceptional instance is explained by the fact that the inmates were in constant communication with one of the houses already infected. The milk dealer who has been the unwilling cause of all this mischief derived his supply partly from his own cows and partly from a farm some miles distant. Those of his customers who drank the milk from the latter source alone suffered from typhoid, and it appears that there were two deaths from typhoid at the farmhouse during the month of February last. We now come to the final connecting link, and it forcibly illustrates the urgent need of sanitary reform in rural districts. The water-supply of this farm was, as is so often the case, situated close to the ash-pits, and on analyzing the water traces of sewage contamination were easily discerned. Under such circumstances it is not surprising that the epidemic soon spread. The water contaminated with the sewage created by typhoid patients had served to wash out the pans, and perhaps even to adulterate the milk sold by this farm, but directly this supply was discontinued the outbreak of typhoid was checked. The history of this epidemic natually recalls the celebrated outbreak of typhoid in Marylebone, which was also traced to a similar cause. With such instances before us it is impossible to refrain from protesting against the continued carelessness that endangers our milk supply. In how many thousand farms are the ash-pits allowed to contaminate the water-supply? How few persons realize the facility with which sewage matter will percolate through the soil till it has reached the nearest watercourse, where it is taken up and consumed by ready victims of contagion.—*Lancet.*

Cold Sponging in Tuberculosis.—Dr. Pocagnik, of Vienna, is a warm advocate for cold sponging in phthisis. He prefers sponging to the cold douche, recommended by Brehmer, on account of the violent shock to the nervous system which the douche inevitably produces. Neither hemoptysis nor great weakness is a counterindication to the use of the cold sponge-bath. Dr. Pocagnik's method of using the bath is as follows: On waking in the morning, the patient rises, stands on a soft, warm rug, and sponges himself quickly from head to foot with water at from 77° to 55° F., according to the temperature of the air. Roughly speaking, he may use either fresh running water, or water that has stood in the room over night, according to the season of the year. He then rubs himself as thoroughly as possible with a rough flesh-glove, and finally dries himself by wrapping the body in a linen sheet. The entire process should not occupy more than five minutes. He then returns to bed, covers himself up well, but not sufficiently to cause perspiration, and remains quiet for half an hour or an hour longer.—*Memorabilien*, 3. Heft, 1878.

Treatment of Post-Partum Hemorrhage.—In the lying-in department of the Charité, in Berlin, from September, 1876, to the end of June, 1877, intra-uterine injections of hot water were employed in 103 puerperal women, to check 112 severe hemorrhages. The water was used at a temperature of 122° F., and contained one per cent. of carbolic acid. The injections were continued for several minutes each time, the bleeding tissue in the interior of the uterus being freely bathed with the hot fluid. With the exception of large doses of ergot, these irrigations constituted the only treatment for puerperal metrorrhagia during the above-mentioned period, and they invariably proved successful. Sometimes, however, it was necessary to repeat them. They were employed in all cases of hemorrhage, whether slight or severe, early or late. The existence of puerperal disease does not counterindicate their employment, but they should not be employed in cases of retained placenta, or of inversion of the uterus. To guard against the decomposition of any clots that might have remained behind, the uterine cavity was washed out once or oftener with a two or three per cent. solution of carbolic acid, on the second or third day after the cessation of the hemorrhage. When this prophylactic irrigation was neglected, a severe endometritis set in occasionally on the third or fourth day after the flooding.—*Centralblatt für Gynäk.*, April 13th.

The Prevention of Mammary Abscess.—Dr. Miller recommends a new preparation of belladonna, which he claims to be more effective than any of the older combinations, in the treatment of threatened mammary abscesses. The preparation is an alcoholic extract of double the strength of the empl. belladon. of the English pharmacopœia. It is dissolved in collodion, to keep it fluid, and a small quantity of camphor is added to the mixture. The painful breasts are painted with this fluid, morning and evening, or, if desirable, oftener; it dries quickly, and has no unpleasant odor. The painting must be continued until complete recovery. Dr. Miller has found this treatment remarkably successful in cases of inflammation of the breast due to cold, to ulcerated nipples, or to obstruction of the milk-ducts. He has also employed it successfully to prevent the secretion of milk; in that case, the painting of the breasts should be begun immediately after labor, and it should be repeated several times a day.—*Edinburgh Med. Journ.*, 1877.

Treatment of Asthma.—M. Sée treats asthma with iodide of ethyl and iodide of potassium. The former is given by inhalation during the dyspnœic attacks; from five to ten drops constitute a dose, and the effect is said to be very rapid and satisfactory. The potash is given in the intervals between the attacks, to ward off their recurrence. M. Sée gives it in large doses, from twenty to forty-five grains per diem. He is not afraid of iodism, which he combats merely by increasing the dose of the drug. In twenty-four cases treated in this way, which have been under observation for several years, his success was very gratifying.—*Gazette Méd. de Paris.*

Treatment of Cystitis by Injections of Quinine.—Dr. Nunn employs injections of sulphate of quinine in cases of cystitis purulenta with strangury. His formula is as follows: ℞. Quinine sulph., gr. xv.; aquæ destillat., ʒ xxv.; adde: acidi sulph., q. s. ad solutionem. From two to three ounces of this solution is injected into the bladder daily, and left there. Under this treatment the strangury soon ceases, and the urine perceptibly improves in appearance. *The Lancet*, February 13th; *Allg. Med. Cent. Zeit.*

Number of Lunatics in Prussia.—In 1876 the number of insane persons in Prussia amounted to 20,115, of whom 10,754 were males and 9,361 females. Of the asylums from whose statistics these figures were taken, fifty-two were public and seventy-three private. Of the entire number of patients, 24.70 per cent. were suffering from secondary insanity, 23.08 per cent. from melancholia, 19.94 per cent. from mania, 10.01 per cent. from paralytic dementia, and 7.42 per cent. from delirium potatorum.

THE YEAR 1877, NOW COMPLETE, COMPRISES

I.—THE SECOND VOLUME OF SMELLIE'S MIDWIFERY. Edited and annotated by Dr. McClintock of Dublin.

II.—THE MEDICAL DIGEST. By Dr. N. Neale. This work consists of carefully classified references to the contents of the chief London Medical Journals during the last thirty years.

III.—THE SECOND AND CONCLUDING VOLUME OF PROF. BILLROTH'S LECTURES ON SURGICAL PATHOLOGY AND THERAPEUTICS, with Index.

IV.—THE FIRST FASCICULUS OF AN ATLAS OF PATHOLOGY. Compiled for the Society from original sources, by a Committee consisting of Dr. Gee, Dr. Green, Dr. Moxon, Dr. Sutton, Mr. Holmes and Mr. Hutchinson, with descriptive letterpress.

The Series for 1878 will probably comprise the following, but it must be understood that the Council is not pledged as regards this announcement:

I.—BIBLIOTHECA THERAPEUTICA. By Dr. Waring. Vol. I. Ready.

II.—A SECOND VOLUME OF DR. LATHAM'S WORKS. Collected and Edited for the Society by Dr. Robert Martin. The first volume of this work was issued in 1875, but new members who join from the year 1876 will be allowed to obtain it separately, in order to complete their sets. (Price $2.50.)

III.—A FIRST PART OF MAYNE'S LEXICON OF MEDICAL TERMS. This work will be edited and wholly re-written for the Society by Mr. Henry Power and Dr. Leonard Sedgwick. The copyright of the original work has been purchased by the Society, and it will in future be obtained only by its members. The Society's edition will be so much remodelled and enlarged that it will constitute almost a new work.

IV.—THE THIRD VOLUME OF SMELLIE'S MIDWIFERY. Edited by Dr. McClintock.

V.—A SECOND FASCICULUS OF THE ATLAS OF PATHOLOGY. This fasciculus will conclude Diseases of Kidneys and probably complete Diseases of the Spleen and Supra-renal Glands. It will be accompanied by a short of *resumé* the present knowledge of the Pathology of Kidney Disease. By Dr. Greenfield. With illustrations from the microscope.

Annual Subscription, $10. Payable in advance.

WM. WOOD & CO., AGENTS FOR THE SOCIETY IN THE UNITED STATES.

Now Ready: Lennox Browne.—The Throat and its Diseases. Illustrated. Royal 8vo. $7.50.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proved itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthpœdic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Prof. of Chem., Mat. Med. and Therp. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, &c., &c.

PRICE LIST.

LACTOPEPTINE (Powder in oz. Bottles) per oz.	$1 00	Elixir Lactopeptine, Strychnia & Bismuth, per doz.	$15 00
" (Powder in oz. Bottles) per doz.	10 00	" Calisaya Bark & Iron, with Lactopeptine, "	15 00
" (Powder in ½ lb. Bottles) per lb.	12 00	Beef, Iron and Wine, with Lactopeptine, "	12 00
Elixir Lactopeptine.....per doz.	15 00	Liquid Lactopeptine..... "	15 00
" Lactopeptine and Bismuth..... "	15 00	Syrup Lactopeptine Compound..... "	15 00

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing-Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain; Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil.

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic**, and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This Animal Vaccine can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

FRANK P. FOSTER, M.D.

We have an arrangement with Dr. Foster by which we receive this Vaccine *fresh daily.*
By this arrangement all supplied by us *is absolutely fresh.*
We can furnish it in any quantity desired, either by express, or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified indorsement of the medical profession of New York

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process.

In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatising Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

Tins, 1/-, 2/-, 5/-, 10/-

AS SUPPLIED TO

Agents for America—E. FOUGERA & CO., NEW YORK.

TO PHYSICIANS AND DRUGGISTS.

THE subject of Unbleached and Hospital Quinine has been so much discussed of late, and appears to be so little understood, that it is deemed proper to submit the following, which is in accord with our best knowledge and experience in the purchase and use of this article, for it should be remembered that the processes used in the manufacture of Quinine in all countries are kept secret by the various manufacturers, who are a limited number, and said to be comprised within about fifteen establishments of much importance.

Bleached Sulphate of Quinine is recognized as pure when it will bear what is called the ether test, which, while it is not an absolute standard, is the recognized and accepted test, and should be applied in accordance with the directions of the United States Pharmacopœia to all white or Bleached Sulphate of Quinine.
